SECTION 1
DISCUSSION

A. PROJECT LOCATION

The proposed Mesa Verde Estates Development Project (Project) is in the City of Calimesa (City) in Riverside County, California. The Project Site is comprised of approximately 1,450 acres of undeveloped land, lying to the west of Interstate - 10 Freeway between Sandalwood Drive Interchange and County Line Interchange, as shown in **Figure 1 - Vicinity Map**. The Project's northern boundary is located alone Riverside County/San Bernardino County Boundary Line.

The proposed master planned development will be comprised of approximately 3,650 residential units, approximately 290 acres of commercial/industrial district, two school sites, several public and private parks, recreational facilities, and natural open spaces areas.

Figure 1 - Vicinity Map

B. PURPOSE AND SCOPE

The purpose of this hydrology study is to analyze existing condition (pre-development condition) and proposed condition (post-development condition) for 100-year frequency storm flows generated from the project site, and from off-site areas that drain through the project site.

The calculated values of the 100-year flows and volumes will be used to develop preliminary sizing of drainage facilities needed to provide on-site flood protection, and to mitigate development impacts by reducing post-project flows exiting the Project to be equal to or less than that under pre-project conditions.

The scope of this study includes the following:

- Provide hydrologic calculations to quantify flow rates and volume of runoff generated from the project site for pre-development and post-development conditions.
- Provide preliminary layout and sizing of drainage facilities needed for collection, conveyance, and detention of post-development flows generated on-site to less than pre-development conditions.
- Provide basin routing calculations for a post-project condition to show that the Project meets flood control and hydromodification requirements.

C. PRE-DEVELOPMENT CONDITION

As shown in **Figure 2 - Pre-Development Site**, under present conditions the Project site is made up of mostly undeveloped terrain with natural watercourses, valleys and hilly areas generally draining towards the west.

Drainage generated from the Project site tends to flow either in the southwesterly or the northwesterly directions. Areas draining towards the southwest drain directly into San Timoteo Creek, and areas draining towards the northwest drain directly into Yucaipa Creek. Yucaipa Creek is ultimately tributary to San Timoteo Creek and drains directly into San Timoteo Creek further west of the Project site.

The Interstate 10 Freeway (I-10) forms the easterly drainage boundary of the Project site. There are three existing culverts under I-10 in the vicinity of the Project. Off-site drainage areas tributary to the three existing culverts have been studied in a report entitled City of Calimesa Master Flood Control and Drainage Plan (Calimesa Master Plan), dated July 16, 1992. A copy of hydrology map from this report is available in Section 5– References.

Going from north to south, the 100-year peak flows tributary to the three culverts are 1,832 cfs, 624 cfs, and 1,624 respectively, based on the Calimesa Master Plan study. Discharges from the two northerly culverts drain to natural watercourses that traverse across the Project site in the southwest direction. Discharge from the third southerly culvert drains to a natural watercourse that runs adjacent to the southerly boundary of the Project.

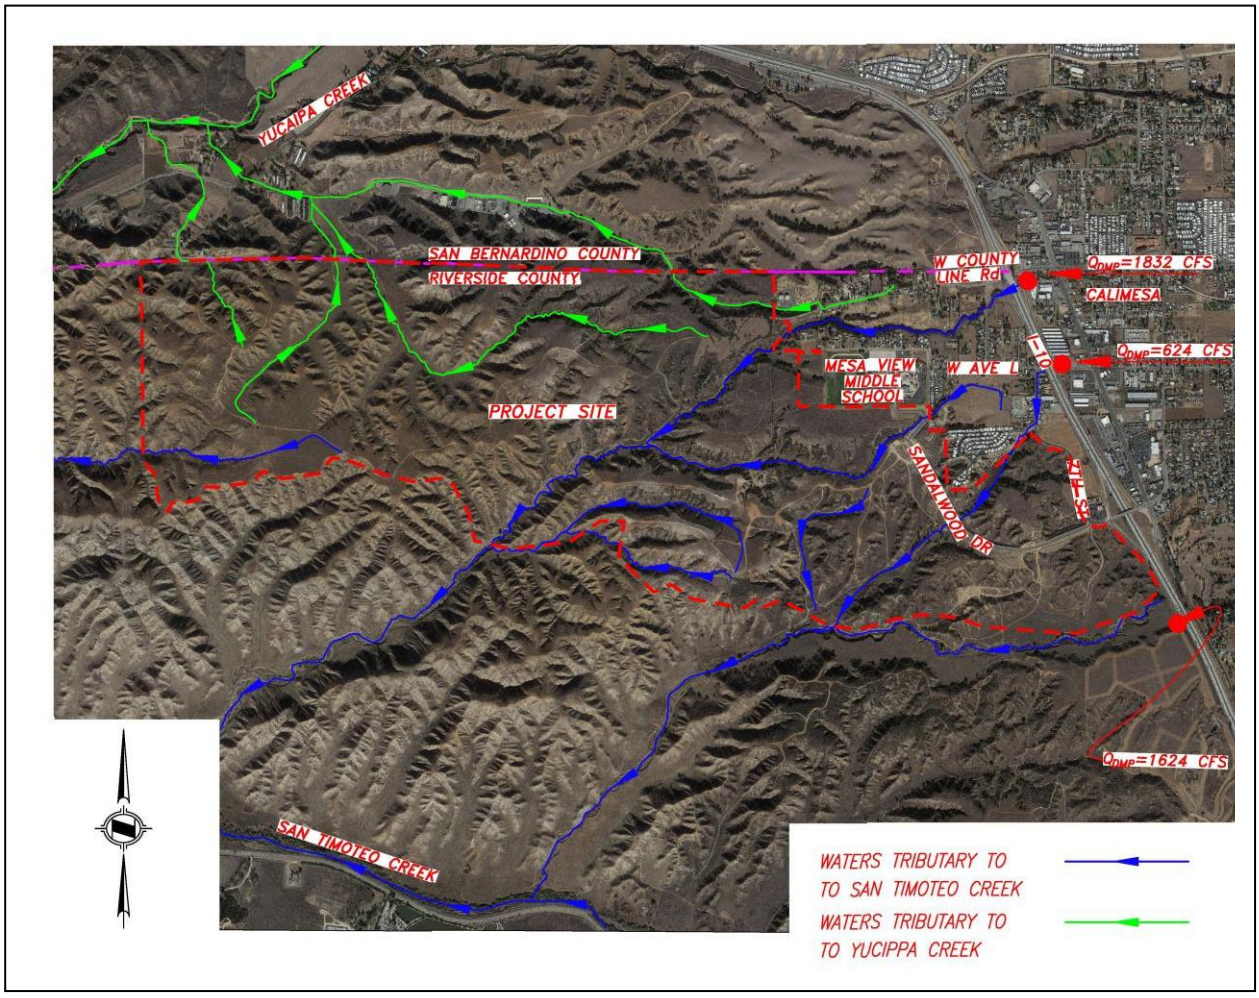

Figure 2. Pre-Development Site

D. POST-DEVELOPMENT CONDITION

The project proposes to develop the Project Site into approximately 3,650 residential units, a commercial/industrial district, two school sites, several parks, recreational facilities, and natural open spaces areas.

Preliminary layout and locations of the proposed storm drain systems and detention basins are shown on **Figure 3- Post-Development Site**. Drainage from the Project site will be collected and conveyed via proposed storm drain systems to 13 detention basins, identified as Basin 1 thru Basin 13 in this report.

The proposed storm drain systems will be designed to convey the 100-year peak flows generated on the Project Site to the proposed basins. The detention basins will reduce

peak flows discharged to existing drainage watercourses downstream of the Project site to equal to or less than the peak flows during pre-development condition.

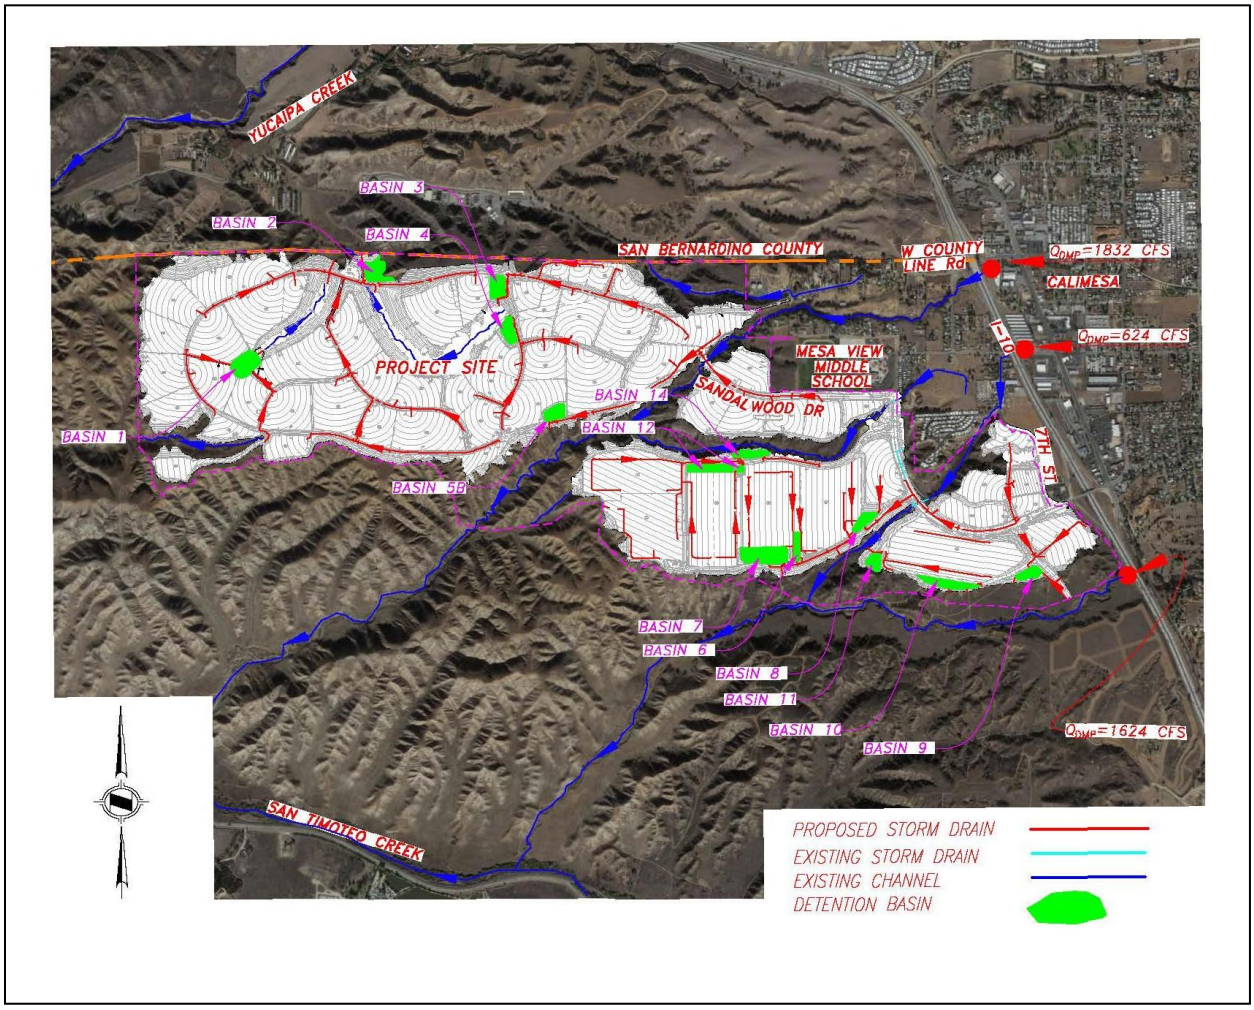

Figure 3. Post-Development Site

E. METHODOLOGY

The methodology used for this hydrology study is based on the Riverside County Flood Control and Water Conservation District's (RCFC&WCD) Hydrology Manual dated April 1976. The hydrology and hydraulic software utilized are accepted by the RCFC&WCD which include the following:

Unit Hydrograph:	Hydrology – Riverside County – Civil Design Software - Version 9.0.
Basin Routing:	Hydrograph Routing – Civil Design Software - Version 9.0.

Hydrologic Soil Groups for the Project Site and areas hydrologically tributary to the Project Site were based on the soil information shown on Plates C-1.06 & C-1.18 of the Hydrology Manual. The Plates C-1.06 & C-1.18 show that the Project Site has soils classified in Hydrologic Soil Group A, B, C, and D with C and D soils being the most prominent. The Soil Group information from the Hydrology Manual is shown on the Hydrology Maps included in this report. A copy of Plates C-1.06 & C-1.18 is provided in Section 5– References.

Land use, % imperviousness, and runoff index numbers for the pre-development and the post-development conditions used in the hydrological calculations are based on the standard land use, imperviousness, and runoff index numbers provided on Plates D-5.5 and D-5.6 in the Hydrology Manual.

The Unit Hydrograph Method as outlined in Hydrology Manual was used to calculate pre-development condition and post-development condition 100-year peak flows generated on the Project Site and were used to size all detention basin and storm drain facilities.

Please note that this report does not include any hydrology calculations for the Off-site Drainage Areas lying to the east of I-10 I Freeway. Peak flows from these off-site tributary areas, based on the 1992 Calimesa Master Plan, were used as baseflow that was added to the on-site flows for the hydraulic evaluation of the impacted watercourses traversing through the Project site. A HEC-RAS flood analysis of the natural channels that includes both the project area flows and the off-site flows from the three tributary areas west of I-10 Freeway is included in a separate study.

F. HYDROLOGIC RESULTS

UNIT HYDROGRAPH METHOD ANALISYS

Pre-Development Condition

The peak flow rates and runoff volumes generated from the Project Site were calculated using the Unit Hydrograph Method. The Unit Hydrograph Method calculations were performed based on the methods outlined in the Hydrology Manual.

The drainage areas were delineated based on the Pre-Development topography. The delineation resulted in the development of 10 separate drainage areas that are labeled Area 1 thru Area 10 in this report. Each drainage area is tributary to a single discharge location (aka Collection Point). These collection points are referred to as CP1 through CP10 in this report. The drainage areas and collection points are shown in the following **Figure 4- Drainage Areas (Pre-Development Condition).**

Note that Areas 5A and 5B have been combined for analysis in the report and referred to as Area 5 in the calculations. Areas 5A and 5B are hydrologically connected by a natural watercourse. Flows generated from the Mesa View Middle School flows south within street cross-section of Sandalwood Drive/Mustang Way, crossing the drainage divide between Areas 5A and 5B on an existing bridge, draining to Area 10.

A Hydrology Map for Pre-Development Condition is available in Section 2 – Pre-Development Condition Hydrology Unit Hydrograph Analysis.

Precipitation values used in the development of the unit hydrographs for the and Pre-Development condition for the Project site were obtained from Plates D-4.3, D-4.4, and Plates E-5.2 – E-5.6 of the Hydrology Manual. A copy of these Plates is included in Section 5 – References.

Lag time, area average mean soil loss rate (F), minimum soil loss rate (Fm) and low loss rate (F*) where developed using procedures shown on Plate E-1.1 of the Hydrology Manual and calculated within the Civil Design Software program.

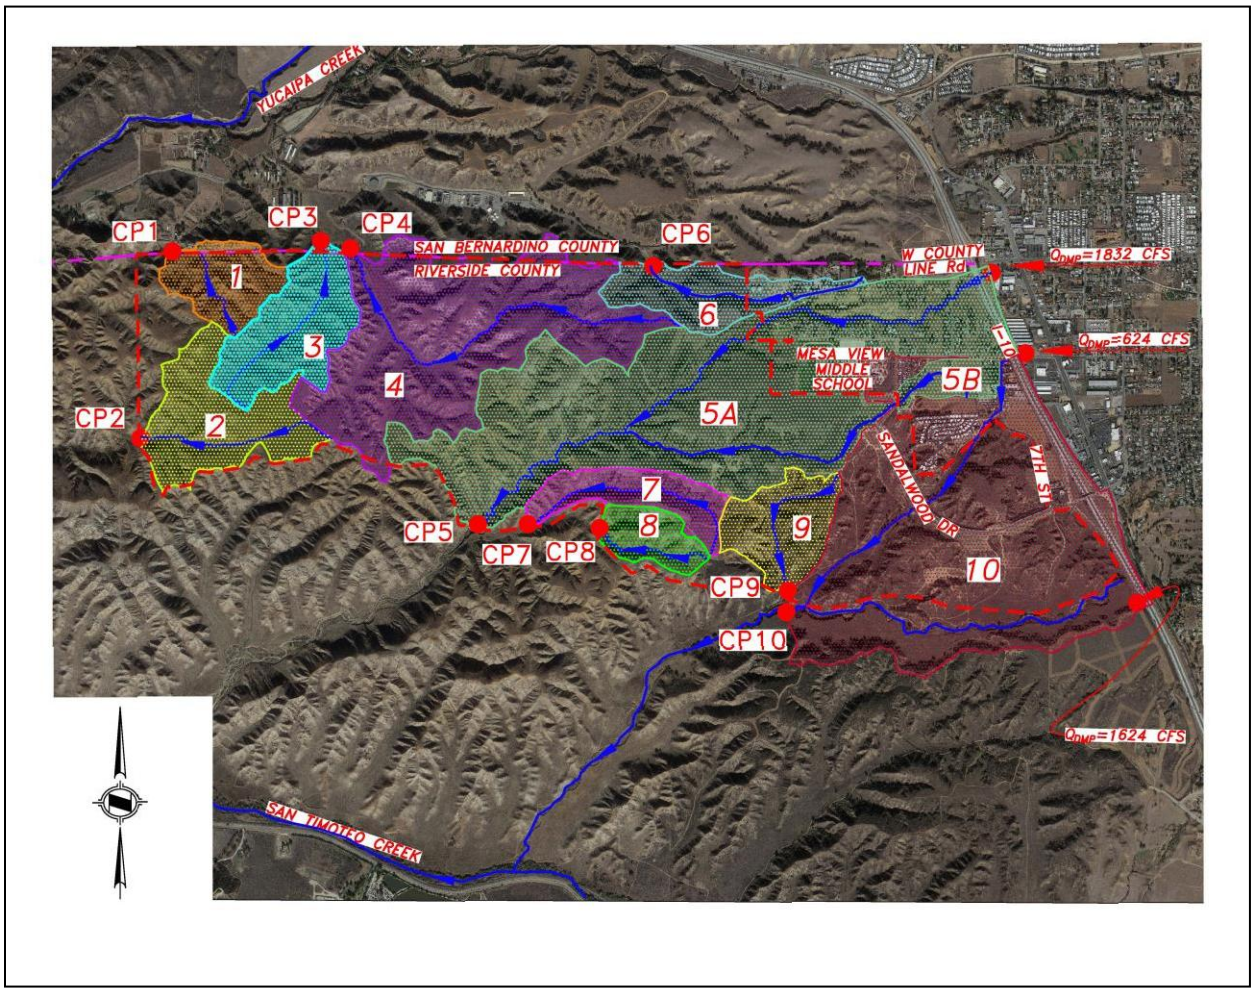

Figure 4- Drainage Areas (Pre-Development Project Condition)

The results of the Unit Hydrograph calculations for the Project in the Pre-Development Condition are summarized in the following table:

Post-Development Condition

The Post Project peak flows for the Project Site and the areas tributary to the Project Site were calculated using the Unit Hydrograph Method.

The on-site drainage areas and off-site drainage areas tributary to the Project Site were delineated based on the preliminary grading of the proposed development. The delineation resulted in the development of 10 major drainage areas which in turn have been subdivided into a total of 30 sub-areas. The major drainage areas are denoted with a number 1 through 10 and the subareas are denoted with a letter. Each major drainage area is tributary to a single collection point. These collection points are referred to as CP1-CP10 in this report and are the same collection points as defined for the pre-development condition analysis. The drainage areas and collection points are shown in the following Figure 5.

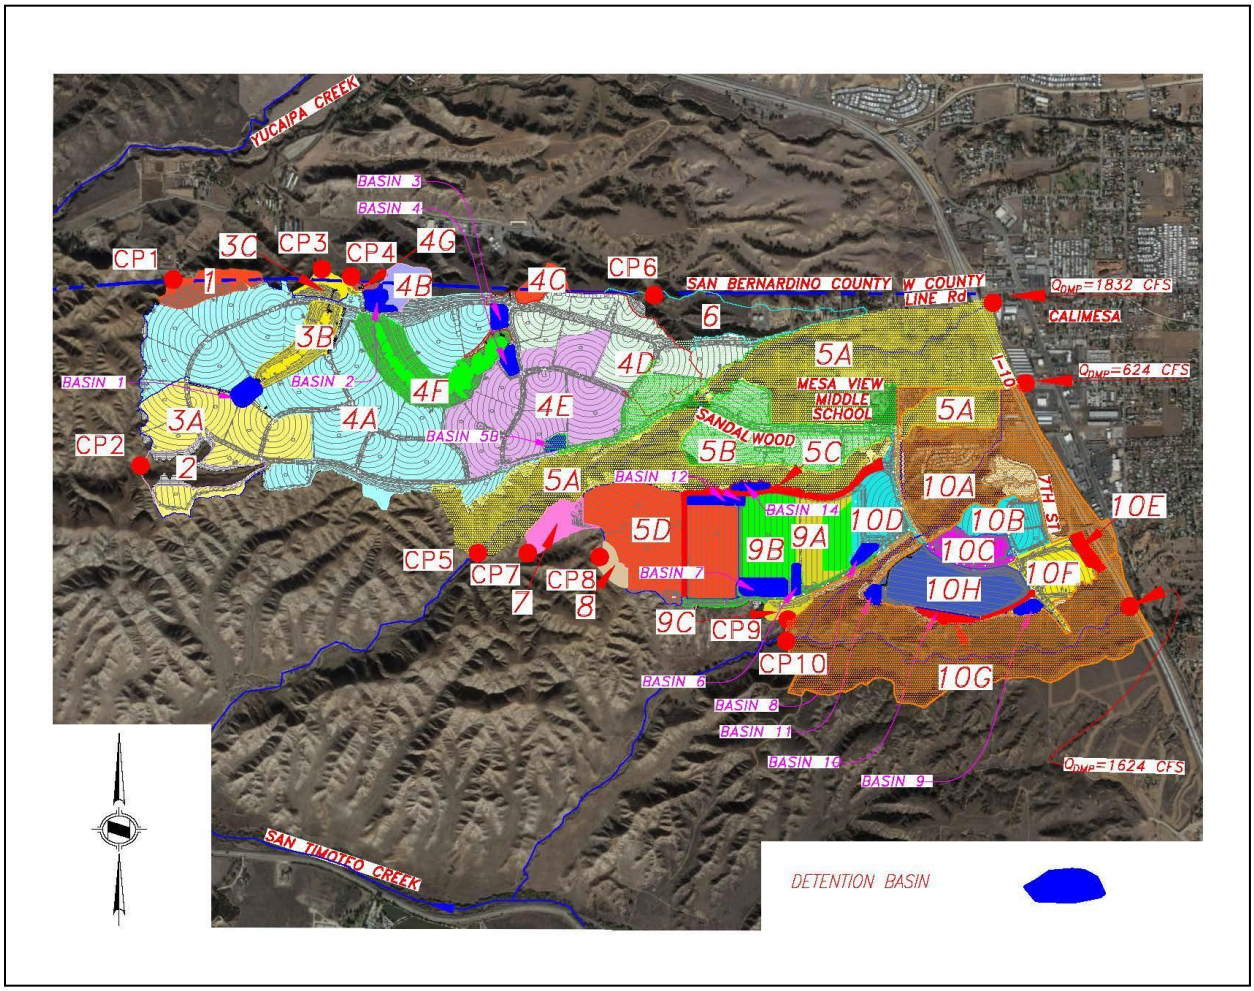

Figure 5. Drainage Areas (Post-Development Condition)

A Hydrology Map of Project for Post-Development Condition is included in Section 3 – Post-Development Condition Hydrology Unit Hydrograph Analysis.

Precipitation values used in the development of the unit hydrographs were obtained from the Hydrology Manuel.

Lag time, area average mean soil loss rate (F), minimum soil loss rate (Fm) and low loss rate (F*) where developed using procedures shown on Plate E-1.1 of the Hydrology Manual and calculated within the Civil Design Software program.

The results of the Unit Hydrograph calculations for the Project in the Post-Development Condition are summarized in the following table:

G. FLOOD MITIGATION

Basin Flood Routing

Based on the results of Unit Hydrograph Method Analysis, the un-detained peak flow rates to collections points CP3, CP4, CP5, CP9 and CP10 increased from Pre-Development Condition to Post-Development Condition. However, the peak flow rates to CP1, CP2, CP6, CP7, and CP8 decrease from Pre-Development Condition to Post-Development Condition. Therefore, drainage areas 1, 2, 6, 7, and 8 do not require detention basins.

To mitigate the increase flow from Pre-Development to Post-Development conditions for the drainage areas tributary to the collection point with increased peak flows from Pre-Development to Post-Development conditions, the project proposes to construct 13 detention basins.

The 100-year post-development condition unit hydrographs for 3-hr, 6-hr and 24hr storms for each sub-area were routed through each proposed basin and routed to the final collection point using the Civil Design Software routing module for unit hydrograph routing. The results of the routing calculations are summarized in the following table:

Table 3. Summary of Detention Basin and Hydrograph Routing Results

A flow chart detailing the hydrologic connectivity of the post-development drainage areas to the proposed basins and downstream collection points are available in **Section 4 – Basin Routing Calculations**.

J. CONCLUSION

The proposed storm drain systems and detention basins will provide adequate flood control protection to the proposed development and will mitigate drainage impacts due to the proposed development.

The following table shows that peak flows tributary to each collection point will be reduced under post-development condition.
