1 Introduction

1.1 Project Overview

The project under consideration by the City of Calimesa (City) is on a 11.2-acre project site located at the intersection of Interstate (I) 10 and Sandalwood Drive in the City of Calimesa. The City is processing a development application from Sandalwood Travel Center, LP (development applicant), requesting entitlements for proposed subdivision of two parcels into three parcels, with a travel center on Assessor's Parcel Number (APN) 411-210-024 including fueling dispensers and a convenience store with a common area. Development of the travel center would also require off-site improvements totaling 1.9 acres.

In addition, the City received a separate application to process a Tentative Parcel Map (TPM) No. 38215 (also referred to as a "Finance Map") from San G Properties, LLC (TPM applicant) for APNs 411-210-024 and 411-210-006. The proposal is to split the site into three stand-alone parcels.

As the approval of the Sandalwood Travel Center development project ("development project" on Parcel 3 only) cannot proceed without the TPM (Finance Map) approval occurring first, these two activities are considered connected actions and would also be considered together as components in the whole of the action pursuant to the California Environmental Quality Act (CEQA). As stated in CEQA Section 15003, "[t]he lead agency must consider the whole of an action, not simply its constituent parts, when determining whether it will have a significant environmental effect." As such, the "proposed project" considered herein consists of the Sandalwood Travel Center development project and the TPM collectively. Any future development proposals on the northern parcels would occur as entitlement actions separately from the proposed project and would require independent analysis under CEQA.

1.2 California Environmental Quality Act Compliance

The City is the lead agency for the proposed project (CEQA Statute Section 21067 and CEQA Guidelines Article 4 and Section 15367). The City Council is the governing body for the approval of the proposed project and adoption of the Mitigated Negative Declaration (MND). Because the proposed project involves a change to the existing site, the City's consideration of the proposed project and its potential environmental effects is a discretionary action subject to CEQA. This Initial Study (IS) and its appendices have been prepared in accordance with the CEQA statute and the state's Guidelines for Implementation of CEQA. This IS, when combined with the Notice of Intent to Adopt an MND, serves as the environmental document for the proposed project pursuant to the provisions of CEQA.

The overarching goal of CEQA is to protect the physical environment. To achieve this goal, CEQA requires that public agencies identify the environmental consequences of their discretionary actions and consider alternatives and mitigation measures, if necessary, that could avoid or reduce significant adverse impacts when avoidance or reduction is feasible. It also gives other public agencies and the public an opportunity to comment on the proposed project.

1.3 Initial Study Checklist

This Environmental Checklist (i.e., Initial Study or "IS") has been prepared pursuant to CEQA Guidelines Sections 15063–15065. The CEQA Guidelines include a suggested checklist to indicate whether a project would have an adverse impact on the environment. The checklist and relevant analyses is found in Chapter 3, Initial Study

Checklist, of this document. Initial Study Checklist Sections 3.1 through 3.21 include an explanation and discussion of each significance determination made in the checklist for the proposed project.

For this IS/MND, one of the following four responses is possible for each environmental issue area:

- Potentially Significant Impact
- Less Than Significant Impact with Mitigation Incorporated
- Less Than Significant Impact
- No Impact

The checklist and accompanying explanation of checklist responses provide the information and analyses necessary to assess environmental impacts relative to the proposed project. In doing so, the City will determine the extent and adequacy of additional environmental review for the proposed project.

1.4 Public Review Process

Public participation is an essential part of the CEQA process. As required by CEQA, the City shall also provide adequate time for other public agencies and members of the public to review and comment on a CEQA document prepared for a proposed project. This IS/MND has been made available to members of the public, agencies, and interested parties for a 30-day public review period in accordance with CEQA Guidelines Section 15105. Public review of the IS/MND is intended to focus "on the proposed finding that the project will not have a significant effect on the environment. If persons and public agencies believe that a project as proposed may have a significant effect, they should: (1) identify the specific effect, (2) explain why they believe the effect would occur, and (3) explain why they believe the effect would be significant" (14 CCR 15204).

This Draft IS/MND is available for review during the 30-day public review period, and the link to this document is available for review on the main page of the City's website at www.cityofcalimesa.net. A hard copy of the Draft IS/MND can be provided by the City upon request. To request a hard copy of the IS/MND for review and/or to provide comments on the IS/MND, please submit to Kelly Lucia via phone or email:

Kelly Lucia, Community Development Director
Phone: 909.795.9801, extension 229
Email: klucia@calimesa.gov

Once the 30-day public review period has concluded, any advisory body of a public agency shall consider the IS/MND together with any comments received during the public review process. The decision-making body shall adopt the proposed MND if it finds there is no substantial evidence that the proposed project will have a significant effect on the environment that cannot be mitigated to less than significant levels, and that the MND reflects the lead agency's independent judgment and analysis. After approval of the project, the City shall file a Notice of Determination at the Riverside County Recorder-Clerk's office within five working days after deciding to carry out or approve the proposed project.

2 Project Description

2.1 Project Location

The project site is located in the northern portion of the City of Calimesa, in the County of Riverside. The 11.2-acre project site, inclusive of the 1.9-acre off-site right-of-way is generally bounded by a commercial development and Sandalwood Drive to the south, an undeveloped dirt lot and a single-family residence to the north, 7th Street to the west, and I-10 to the east. Regional access to the project site is provided by I-10. The 11.2-acre project site is assigned APNs 411-210-024 and 411-210-006. The project site is further defined as the northwest portion of Section 14, Township 2 South, Range 2 West of the San Bernardino Meridian. No development is proposed within the northern parcels (Parcels 1 and 2), which are collectively referred to as the northern parcels. The proposed development area consists of the southern parcel (Parcel 3), which is located within APN 411-210-024. Primary local access to the project site is provided via 7th Street, a northwest-oriented Secondary Arterial roadway. Figure 1, Project Location, shows the general location of the project site in relation to the larger Southern California region. Figure 2, Proposed TPM 32815 Finance Map, depicts the northern and Parcels 1 through 3, as described above.

2.2 Local Setting

As shown in Figure 2, an existing commercial development is located to the south, a single-family home and undeveloped area are located to the north, 7th Street and undeveloped land are located to the west, and undeveloped land and I-10 are located to the east of the site. The project site is gently sloping to the west, with elevations ranging from approximately 2,371 feet above mean sea level. The entire project site has been used for agriculture since at least 1938 (Historic Aerials 1958). Under prior environmental review and regulatory permits, the site was graded in 2009 for the purpose of implementing a drainage improvement project, but no other work has occurred on the site since 2009. The project site is still undeveloped, has tire tracks throughout, and appears to be subject to mowing and disking on a regular basis. Overhead utility lines run along the western perimeter of the project site on the east side of 7th Street.

2.3 Proposed Project

The proposed project consists of two components: an 11.2-acre TPM, and within that area, commercial development. The commercial development includes two components: the on-site development component consisting of the Sandalwood Travel Center and the off-site component consisting of 1/2-width street improvements to widen the road (directly along the east side of the proposed development area. As described in more detail below, the TPM proposes to split the site into three parcels, and the proposed commercial development project consists of the Sandalwood Travel Center located on Parcel 3 of the TPM. As the approval of the development project cannot proceed without the TPM approval occurring first, these two activities are considered connected actions and would also be considered together as components in the whole of the action pursuant to CEQA. As stated in CEQA Guidelines Section 15003, “[t]he lead agency must consider the whole of an action, not simply its constituent parts, when determining whether it will have a significant environmental effect.”

2.3.1 Tentative Parcel Map

The proposed TPM would split the 11.2-acre site into the three parcels described earlier. The project site is designated Community Commercial (C-C) in the General Plan Land Use Map (City of Calimesa 2014a) and the City's Zoning Districts (City of Calimesa 2014b) (Figure 3, General Plan Land Use and Zoning Designations). No changes to the land use designation or zoning are proposed as a part of the TPM. The proposed TPM is a Finance Map only, and no grading, new streets, development, or other physical improvements are proposed as part of the TPM.

2.3.2 Sandalwood Travel Center

The proposed development project would occur on Parcel 3 of the TPM and includes construction of a travel center which would include four multi-product fuel dispensers (MPDs), a convenience store with a common area, a five-position diesel canopy with six dispensers, parking, site access improvements, and signage (Figure 4, Site Plan). Additional details regarding each project component, including off-site improvements, as well as project construction activities, are included below. Development of the Sandalwood Travel Center would require Conditional Use Permits (CUPs) to allow the proposed operation of fuel dispensers and for the proposed sale of alcohol.

2.3.3 On-Site Development

Multi-Product Dispensers

The four MPDs, which dispense both gasoline and diesel fuel, would be developed in the northern portion of the development project site in a square-shaped alignment with an MPD in each corner. The MPDs would be located beneath a 35-foot-high canopy measuring approximately 5,000 square feet. Primary access to the MPDs within the project site would be from the south, east, and north sides of the MPDs.

Convenience Store

A convenience store and common area would be developed as a 7,034-square-foot structure in the center portion of Parcel 3. The convenience store would encompass approximately 4,884 square feet in the eastern portion of the building. The common area would encompass approximately 2,150 square feet in the western portion of the building. The common area would include restrooms, four shower rooms, a driver lounge, a business center, a storage room, a laundry area, and an outdoor patio with barbeque pit. The convenience store would include the sale of alcoholic beverages. The convenience store and common area would be designed and constructed in accordance with Calimesa Municipal Code Chapter 18.25.050(G).

Five-Position Diesel Canopy

The five-position diesel canopy with six diesel dispensers would be developed beneath an approximately 3,000-square-foot canopy south of the common area. Three underground storage tanks would be installed west of the fuel canopy to store fuel for the diesel fuel dispensers.

Parking

A total of 43 standard parking stalls would be developed. The parking stalls would be located north and west of the structure in the center of the site. A total of 12 electric vehicle charging station stalls would be located along the northern boundary of the site. A total of 19 semi-truck/trailer parking stalls would be developed on the southern side

of the project site. Six carpool parking stalls would also be provided. Parking stalls would be designed and installed in accordance with Calimesa Municipal Code Chapter 18.45 to ensure adequate on-site parking is available.

Site Access

Primary vehicular access to the Sandalwood Travel Center would be available from three driveways located within the northern, center, and southern areas of the project site. All three driveways would provide ingress/egress and would be located along 7th Street. The northern driveway would be located northwest of the MPDs, the center driveways would be located west of the fueling station, and the southern driveway would be located directly north of the existing commercial development. All three driveways would provide access to the project site via right-/left-turn access from 7th Street. All three driveways would be the standard maximum driveway width of 40 feet. The northern driveway would serve be a full-access driveway for the service station, convenience store, and common area. The center and southern driveways would be restricted to truck use only. The southern driveway would be an inbound-only full-access driveway, and the center driveway would be an outbound-only full-access driveway.

Signage

A new internally illuminated freeway pylon display sign would be constructed on the southeast corner of the project site and would be visible from I-10. The freeway pylon would contain digital signage for gasoline and diesel prices only. It would also contain static signage for the convenience store, fuel station, truck weighing scales, and other commercial tenants that may co-locate within the convenience store. With the approval of the proposed variance, the pylon sign would be 80 feet tall. Three additional 4-foot-tall monument signs would be constructed on the project site adjacent to 7th Street displaying signage for Tesla chargers, food establishments, racing fuel prices, and "Unocal" diesel prices for trucks. Additional smaller signage displaying gasoline and diesel prices and certified CAT scales would be located throughout the project site and on the proposed building.

2.3.4 Off-Site Improvements

The project includes approximately 1.9 acres of off-site improvements, which would consist of road improvements that include the eastern half of 7th Street, including curb and gutter installation and a V-ditch, just west of the proposed Sandalwood Travel Center along the western boundary of the property.

2.3.5 Project Construction

All construction activities would occur during the allowable hours established by Section 8.15.080(B) of the City's Municipal Code. Construction is anticipated to begin in 2026 and last approximately 12 months.

2.4 Project Approvals

As the lead agency under CEQA, the City has the primary responsibility for approving and carrying out the proposed project and for ensuring that CEQA and all other applicable regulations are met. The project entitlements from the City, as well as other agencies and their potential permitting approvals or review authority over the proposed project, are listed in Table 1.

Table 1. Approvals and Permits Required for the Proposed Project

Agency	Applicable Regulation/Approval/Permit
City of Calimesa	▪ Environmental Assessment (EA) for California Environmental Quality Act clearance ▪ Development Plan Review (DPR) for approval of the site plan, floor plan, architectural elevations, landscape plan, grading plan, and other site design elements ▪ Tentative Parcel Map to split the site into three parcels ▪ Conditional Use Permits to allow for the operation of the fuel dispensers and for the sale of alcohol ▪ Variance to allow for the development of an 80-foot-tall freeway pylon with digital fuel pricing and to allow three 4-foot-tall monument signs along 7th Street
State Water Resources Control Board	▪ Construction General Permit required for discharges of stormwater associated with construction activities
Regional Water Quality Control Board–Santa Ana Region (Region 8)	▪ Stormwater Pollution Prevention Plan – must be prepared prior to project construction and implemented during construction activities, pursuant to Construction General Permit
County of Riverside Department of Environmental Health	▪ Underground Storage Tank Permit
Yucaipa Valley Water District	▪ Development Agreement for requirements for sewer service (executed prior to issuance of any grading or building permit
South Mesa Water Company	▪ Review and approval of connection to South Mesa Water Company infrastructure for domestic water services
Southern California Gas	▪ Review and approval of natural gas service
Southern California Edison	▪ Review and approval of electrical service and proposed undergrounding of utility lines along 7th Street
California Department of Alcoholic Beverage Control (ABC)	▪ ABC Permit for the sale of alcohol

3 Initial Study Checklist

1. **Project title:**

   Sandalwood Travel Center Project and Tentative Parcel Map 38215

2. **Lead agency name and address:**

   City of Calimesa
   908 Park Avenue
   Calimesa, California 92320

3. **Contact person and phone number:**

   Kelly Lucia, Community Development Director
   909.795.9801 Ext. 229

4. **Project location:**

   APN 411-210-024 and APN 411-210-006 along I-10 at Sandalwood Drive in Calimesa, California 92320

5. **Project sponsor's name and address:**

   Development Applicant:

   Sandalwood Travel Center, LP
   PO Box 1958
   Corona, California 92878

   TPM Applicant:

   San G Properties, LLC
   PO Box 1112
   Corona Del Mar, California 92625

6. **General plan designation:**

   C-C – Community Commercial

7. **Zoning:**

   C-C – Community Commercial

8. **Description of project. (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary):**

The project consists of two overall components: a commercial development (Sandalwood Travel Center or "development project") and the proposed 11.2-acre TPM on which the development project would be sited. The TPM would split the site into three separate parcels. The northern parcels (1 and 2) would be avoided and are not proposed for development at this time. Within the southern parcel (Parcel 3), the Sandalwood Travel Center development would include fueling dispensers and a convenience store with a common area. The development of the travel center would also require off-site improvements totaling 1.9 acres, which are included in the overall project acreage. As the approval of the development project cannot proceed without the TPM approval occurring first, these two activities are considered connected actions and would also be considered together as components in the whole of the action. The proposed project would require the following discretionary approvals:

- City approval of the IS/MND (EA 20-04)
- Tentative Parcel Map (TPM 38215)
- Development Plan Review (DPR 20-05)
- CUPs
  - CUP 20-04
  - CUP 20-05
- Variance
  - VAR 23-02

The detailed project description is included in Chapter 2 of this IS/MND.

9. **Surrounding land uses and setting (Briefly describe the project's surroundings):**

West: Mesa Verde Estates Specific Plan. Mixed Use (Commercial & MF 20 dwelling units per acre). Land directly west of 7th Street is currently undeveloped, but the Specific Plan has been approved.

South: C-C – Community Commercial. The land directly south of the project site is developed with two commercial structures.

East: I-10. The land east of the project site is designated as California Department of Transportation (Caltrans) right-of-way for I-10.

North: BP – Business Park. The land northwest of the project site is currently developed with a single-family home and the land to the northeast is undeveloped.

10. **Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):**

- State Water Resources Control Board – Construction General Permit
- Regional Water Quality Control Board (RWQCB) – Santa Ana Region (Region 8) – Stormwater Pollution Prevention Plan (SWPPP)

- County of Riverside Department of Environmental Health – Underground Storage Tank Permit
- Yucaipa Valley Water District – Sewer connection and service
- South Mesa Water Company – Domestic water connection and service
- California Department of Alcoholic Beverage Control (ABC) – ABC Permit

11. Have California Native American Tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to Tribal cultural resources, procedures regarding confidentiality, etc.?

Refer to Section 3.18, Tribal Cultural Resources, for a discussion of consultation between the City and California Native American Tribes.

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project. However, after implementation of mitigation, none of these impacts would be considered a "Potentially Significant Impact," as indicated by the checklist on the following pages. The boxes checked below indicate those resource areas requiring mitigation.

☐ Aesthetics	☐ Agriculture and Forestry Resources	☐ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Energy
☒ Geology and Soils	☐ Greenhouse Gas Emissions	☐ Hazards and Hazardous Materials
☐ Hydrology and Water Quality	☐ Land Use and Planning	☐ Mineral Resources
☒ Noise	☐ Population and Housing	☐ Public Services
☐ Recreation	☐ Transportation	☒ Tribal Cultural Resources
☐ Utilities and Service Systems	☐ Wildfire	☒ Mandatory Findings of Significance

Determination (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date

Evaluation of Environmental Impacts

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.
4. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063l(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analysis Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
    a. The significance criteria or threshold, if any, used to evaluate each question; and
    b. The mitigation measure identified, if any, to reduce the impact to less than significance

3.1 Aesthetics

		Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
I.	**AESTHETICS –** Except as provided in Public Resources Code Section 21099, would the project**:**				
a)	Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b)	Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c)	In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☒	☐
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

TPM 38215 is a Finance Map only with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, no impacts would occur relative to aesthetics on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate aesthetics analysis and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3.

a) Would the project have a substantial adverse effect on a scenic vista?

No Impact. The pattern of ridges in the Calimesa area divides the area into distinctive visual units. The project site is within the Northern Plateaus and Ravines viewshed area, defined by the City's General Plan (City of Calimesa 2014a). The Northern Plateaus and Ravines are composed of higher plateaus and scattered scrub-covered ravines. Higher elevations in the Northern Plateaus and Ravines viewshed project panoramic views of the Yucaipa and San Jacinto valleys, the San Bernardino and San Jacinto Mountains, and surrounding communities. The project site is relatively flat, and elevation increases east of the site, west of 7th Street. The San Bernardino Mountains are visible in the distance from the project site to the northeast. Due to distance and nearby urban development, the project site would not be visible from scenic vistas in the San Bernardino Mountains. As such, the proposed project would have no impact on a scenic vista or view to nearby open space areas.

b) Would the project substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. The entire project site is currently vacant and has been previously disturbed from disking and other vegetation clearing activities intended to reduce wildfire risk. The project site is generally flat, containing minimal vegetation. Existing overhead power lines run north–south along the western project site boundary, adjacent to 7th Street. There are no visual resources, such as protected trees, rock outcroppings, or historic buildings, within the project site that would be impacted by development of the proposed project.

The nearest officially designated state scenic highway to the project site is Highway 38 (from 0.1 miles east of South Fork Camp Ground to State Lane, approximately 2.9 miles south of Route 18), located approximately 18.1 miles to the northeast, within the San Bernardino Mountains (Caltrans 2019). This 15.7-mile portion of Highway 38 is located within San Bernardino County, near Sugarloaf Mountain. Due to the project site's distance from the nearest designated state scenic highway, the proposed project would not substantially damage scenic resources within a state scenic highway. In addition, the City of Calimesa has not designated any local scenic corridors. As such, the proposed project would have no impact on a scenic resource within a state scenic highway.

c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. The majority of the project site consists of undeveloped disturbed land with minimal vegetation. There are currently no sidewalks, curb-and-gutters, or landscaping improvements along the 7th Street frontage.

The proposed project would be developed in the northern portion of the City and southern portion of TPM 38215, adjacent to I-10, existing commercial development, and the Mesa Verde Specific Plan area. The closest residence is currently located north of the project site. The proposed Sandalwood Travel Center development project would be similar, in character and design, as the commercial development on the parcel directly to the south. The development applicant would be required to install pedestrian, storm drain, and landscape improvements within the perimeter of the site and along the frontage with 7th Street, consistent with City standard drawings and regulations. These improvements would aid in defining the roadway along the property boundary with landscaping improving the scenic quality of the site.

The project site is designated as Community Commercial (C-C) in the City's Land Use and Zoning Map (City of Calimesa 2014a). The proposed Sandalwood Travel Center development would not exceed the maximum permitted height of 35 feet within the C-C zoning designation, and the structures would be similar in height to adjacent commercial development. Figure 5, Canopy Elevations, shows front and side views of the canopies.

The Sandalwood Travel Center development convenience store, common area and fuel dispensers are conditionally permitted within the C-C zoning designation. In compliance with the City's Zoning Code, the applicant has applied to the City for CUPs (CUP 20-04, CUP 20-05) for operation of the fuel canopies and for the sale of alcohol, and the City will conduct discretionary review of the CUPs. Because the City currently

only allows the development of one monument sign on the site, the development applicant has applied to the City for a variance to allow the development of two additional monument signs and to allow an 80-foot-tall freeway pylon with digital fuel pricing. The City would approve the CUPs and variance if they determine that the proposed land uses have no adverse effect on the surrounding area.

Upon approval of the CUPs and variance, the project would introduce land uses within the consistent with the vision of the City's General Plan and consistent with the commercial development adjacent to the site. As such, the proposed project would not conflict with the zoning regulations governing scenic quality or substantially degrade the visual quality of the site. In conclusion, the proposed project would have a less than significant impact related to the existing visual character or quality of public views.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact. Existing sources of nighttime lighting near the project site include lighting from the existing commercial development adjacent to the southern project boundary and lighting from I-10 east of the project site.

The development applicant would be required to install and maintain adequate lighting within the project site for security and safety purposes. New light sources associated with the project could introduce light and/or glare to the project area. Proposed light poles/fixtures would not exceed the maximum height of 20 feet (6.1 meters) allowed within commercial/industrial zones (City Municipal Code Chapter 18.120.090[C]). The project would also include the installation of three illuminated monument signs to display gasoline prices, food establishments, the Tesla charging station, and other relevant components of the project to motorists traveling along I-10. In addition, the lights would be shielded and directed downward to focus lighting within desired areas and minimize light spillover onto adjacent properties. Use of shields and directing of lighting would also reduce opportunities for glare associated with project lighting.

Potential impacts associated with lighting would be further reduced through compliance with the City's Municipal Code, Chapter 18.120.090. All lighting must also comply with Title 24 of the California Code of Regulations, Part 6 (and any successor regulations), and the Uniform Building and Electrical Codes. All lights shall be directed, oriented, and shielded to prevent light trespass or glare into adjacent properties, on public rights-of-way, and/or driveway areas. In addition, all outdoor lighting within the project site must be turned off or reduced by at least 50% beginning at 10:00 p.m. or close of business, until dawn or opening of business. For the reasons described above, project lighting and glare impacts would be less than significant and would not adversely affect existing nighttime and daytime views in the area.

3.2 Agriculture and Forestry Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
II. AGRICULTURE AND FORESTRY RESOURCES – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

The following analysis is provided to address the agricultural and forestry resource impacts of the proposed project within the proposed TPM 38215 area, including the Sandalwood Travel Center development (i.e., Parcel 3 of the TPM). No development is proposed on the northern parcels.

a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. The project site is composed of vacant, disturbed land. The project site is identified as Farmland of Local Importance, and surrounding properties are identified as Urban and Built-Up Land and Other Land by the California Department of Conservation (DOC 2018). Based on review of historical aerials, the project

site and surrounding area have not been utilized for agricultural land uses for at least two decades (Google Earth 1996–2020). In addition, the City has designated the project site for commercial land uses (City of Calimesa 2014a). As such, construction and operation of the proposed project would not result in the conversion of important farmland to non-agricultural use.

b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. Refer to Section 3.2(a). The project site is zoned for Community Commercial (C-C) (City of Calimesa 2014b) and is not in a Williamson Act contract.

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. The project site is composed of vacant, disturbed land, bounded by existing commercial development to the south, I-10 to the east, and additional vacant land to the north and west. Neither forest land nor timberlands are located on the project site; therefore, construction and operation of the proposed project would not impact these resources.

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. Refer to Section 3.2(c).

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

No Impact. Refer to Sections 3.2(a) and 3.2(c).

3.3 Air Quality

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
III. AIR QUALITY – Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, there would be no impacts to air quality relative to the northern parcels. Any future development proposed on the northern parcels would be subject to a separate air quality analysis and CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the air quality modeling results (included as Appendices A-1 and A-2 to this IS/MND).

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less Than Significant Impact. The project site is located within the South Coast Air Basin (SCAB) under the jurisdiction of the South Coast Air Quality Management District (SCAQMD), which is the local agency responsible for administration and enforcement of air quality regulations for the area. The SCAQMD has established criteria for determining consistency with the Air Quality Management Plan (AQMP), currently the 2022 AQMP (SCAQMD 2022), in Chapter 12, Sections 12.2 and 12.3, in the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993). The criteria are as follows:

- **Consistency Criterion No. 1:** The project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP.
- **Consistency Criterion No. 2:** The project will not exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

Consistency Criterion No. 1

Consistency Criterion No. 1 evaluates the proposed project's potential impacts regarding Impact 3.3(b) (the project's potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation impact analysis). As discussed in the response to Impact 3.3(b), the proposed project would result in a less than significant impact associated with the violation of an air quality standard. Because the proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, the proposed project would not conflict with Consistency Criterion No. 1 of the SCAQMD CEQA Air Quality Handbook.

Consistency Criterion No. 2

While striving to achieve the National Ambient Air Quality Standards (NAAQS) for ozone (O_3) and fine particulate matter ($PM_{2.5}$, particles less than 2.5 microns in diameter) and the California Ambient Air Quality Standards (CAAQS) for O_3, coarse particulate matter (PM_{10}, particles less than 10 microns in diameter), and $PM_{2.5}$ through a variety of air quality control measures, the 2022 AQMP also accommodates planned growth in the SCAB. Projects are considered consistent with, and would not conflict with or obstruct

implementation of, the AQMP if the growth in socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP (per Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook).

The SCAQMD primarily uses demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by the Southern California Association of Governments (SCAG) for its Regional Transportation Plan (RTP) / Sustainable Community Strategies (SCS) (SCAG 2020), which is based on general plans for cities and counties in the SCAG, for the development of the AQMP emissions inventory (SCAQMD 2022).[1] The SCAG 2020 RTP/SCS (Connect SoCal), and associated Regional Growth Forecast, are generally consistent with the local plans; therefore, the 2022 AQMP is generally consistent with local government plans.

The project site is designated Community Commercial (C-C) in the General Plan Land Use Map (City of Calimesa 2014a) and the City's Zoning Districts (City of Calimesa 2014b). The proposed project will comply with all Zoning Code development and design standards for Commercial Zone Districts, outlined in Chapter 18.25 of the City's Municipal Code. A variance will be required for the installation of two (of the three) monument signs and to allow an 80-foot-tall freeway pylon with digital fuel pricing. The convenience store, common area and fuel dispensers are conditionally permitted within the C-C zoning designation. The proposed project would be consistent with the current zoning and General Plan land use designation. In addition, the proposed project does not include development that would result in population growth.

The proposed project is expected to employ up to 15 persons. According to SCAG's 2020 RTP/SCS, the 2016 employment was 1,600 jobs and the projection for 2045 is 4,100, with an annual growth rate of 83 jobs per year. The proposed project would not exceed the growth projections for employment. Because the proposed project is consistent with the growth projections of the City and the underlying growth projections of the 2022 Final AQMP, the proposed project would not result in a conflict with, or obstruct implementation of, the applicable air quality plan. Accordingly, the proposed project would meet Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook.

Impact Summary

As described previously, the proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations and would not conflict with Consistency Criterion No. 1. The proposed project would be consistent with the land use assumptions and demographic growth forecasts in the SCAG 2020 RTP/SCS; therefore, it would also be consistent with the SCAQMD 2022 AQMP, which based future emission estimates on the SCAG 2020 RTP/SCS. Thus, the proposed project would not conflict with Consistency Criterion No. 2. Based on these considerations, impacts related to the proposed project's potential to conflict with or obstruct implementation of the applicable air quality plan would be less than significant.

[1] Information necessary to produce the emission inventory for the SCAB is obtained from the SCAQMD and other governmental agencies, including CARB, Caltrans, and SCAG. Each of these agencies is responsible for collecting data (e.g., industry growth factors, socio-economic projections, travel activity levels, emission factors, emission speciation profile, and emissions) and developing methodologies (e.g., model and demographic forecast improvements) required to generate a comprehensive emissions inventory. SCAG incorporates these data into their Travel Demand Model for estimating/projecting vehicle miles traveled and driving speeds. SCAG's socio-economic and transportation activities projections in their 2020 RTP/SCS are integrated in the 2022 AQMP (SCAQMD 2022).

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less Than Significant Impact. Construction and operation of the proposed project would result in emissions of criteria air pollutants from mobile, area, and energy sources, which may cause exceedances of national and California ambient air quality standards or contribute to existing nonattainment of ambient air quality standards. The following discussion identifies potential short-term construction and long-term operational impacts that would result from implementation of the proposed project.

Construction Emissions

Emissions from the construction phase of the project were estimated using the California Emissions Estimator Model (CalEEMod) Version 2022.1.1.29 (CAPCOA 2022). Construction scenario assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the development applicant and CalEEMod default values when project specifics were not known.

For purposes of estimating project emissions (including on-site and off-site construction activities) and based on information provided by the development applicant, construction of the project was assumed to have commenced in December 2025[2] and would last approximately 13 months, ending in December 2026. The analysis contained herein is based on the following assumptions (duration of phases are approximate):

- **Site Preparation:** 1 week (December 1, 2025–December 5, 2025)
- **Grading:** 2 weeks (December 6, 2025–December 17, 2025)
- **Building Construction:** 11 months (December 18, 2025–November 4, 2026)
- **Paving:** 1 month (November 5, 2026–November 30, 2026)
- **Architectural Coating:** 1 month (December 1, 2026–December 24, 2026)

The project is estimated to require 4,816 cubic yards of export during grading. CalEEMod default trip length values were used for the distances for all construction-related trips. Construction worker, vendor, and haul truck trips are based on CalEEMod default assumptions where project-specific information was not available.

The construction equipment mix and vehicle trips used for estimating the project-generated construction emissions are shown in Table 2, Construction Scenario Assumptions.

[2] The analysis assumed a construction start date of December 2025, which represented the earliest date construction would have initiated at the time of analysis. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant and GHG emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Table 2. Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Site Preparation	18	4	0	Rubber Tired Dozers	3	8
				Tractors/Loaders/Backhoes	4	8
Grading	16	4	76	Excavators	1	8
				Graders	1	8
				Rubber Tired Dozers	1	8
				Tractors/Loaders/Backhoes	3	8
Building Construction	68	28	0	Cranes	1	7
				Forklifts	3	8
				Generator Sets	1	8
				Tractors/Loaders/Backhoes	3	7
				Welders	1	8
Paving	20	4	0	Cement and Mortar Mixers	2	6
				Pavers	1	8
				Paving Equipment	2	6
				Rollers	2	6
				Tractors/Loaders/Backhoes	1	8
Architectural Coating	14	4	0	Air Compressors	1	6

Source: See Appendices A-1 and A-2 for details.

Any future construction resulting from implementation of the project would be required to comply with SCAQMD Rule 403 to control dust emissions during any dust-generating activities. SCAQMD Rule 403 requires implementation of various best available fugitive dust control measures for all construction activity sources within its jurisdictional boundaries. Dust control measures include, but are not limited to, maintaining stability of soil through pre-watering of site prior to clearing, grubbing, cut and fill, and earth-moving activities; stabilizing soil during and immediately after clearing, grubbing, cut and fill, and other earth-moving activities; stabilizing backfill during handling and at completion of activity; and pre-watering material prior to truck loading and ensuring that freeboard exceeds 6 inches. While SCAQMD Rule 403 requires fugitive dust control beyond watering control measures, compliance with Rule 403 is represented in CalEEMod by assuming twice daily watering of active sites (55% reduction in PM_{10} and $PM_{2.5}$ [CAPCOA 2022]).

Construction of the proposed project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and volatile organic compound off-gassing) and off-site sources (i.e., on-road haul trucks, vendor trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emission levels can only approximately be estimated with a corresponding uncertainty in precise ambient air quality impacts.

Internal combustion engines used by construction equipment, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of volatile organic compounds (VOCs), nitrogen oxides (NO_x), carbon monoxide (CO), PM_{10}, and $PM_{2.5}$. The application of architectural coatings, such as exterior application/interior paint and other finishes, and application of asphalt pavement would also produce VOC emissions; however, the development applicant is required to procure architectural coatings from a supplier in compliance with the requirements of SCAQMD's Rule 1113 (Architectural Coatings).

Table 3 presents the estimated maximum daily construction emissions generated during construction of the proposed project.

Table 3. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
2025	3.39	31.87	31.27	0.06	21.29	11.43
2026	3.93	11.09	18.13	0.03	1.52	0.64
Maximum Daily Emissions	**3.93**	**31.87**	**31.27**	**0.06**	**21.29**	**11.43**
SCAQMD Threshold	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Appendix A-1.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
The values shown are the maximum summer or winter daily emissions results from California Emissions Estimator Model (CalEEMod).

As shown on Table 3, daily construction emissions would not exceed the SCAQMD significance thresholds for VOC, NO_x. CO, sulfur oxides (SO_x), PM_{10}, or $PM_{2.5}$ during construction in all construction years. Construction-generated emissions would be temporary and would not represent a long-term source of criteria air pollutant emissions. As such, impacts would be less than significant.

Operational Emissions

Operation of the proposed project would produce VOCs, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from area sources, including natural gas combustion, use of consumer products, and motor vehicle trips the project site. Area source emissions also include fugitive VOC emissions from the fueling station from loading, breathing, refueling, hose permeation, and spillage.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from hearths, consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating, water heating, and stoves are calculated in the building energy use module of CalEEMod, as described in the following text. A spreadsheet model was used to estimate emissions from the fueling station.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, or architectural coatings are not considered consumer

products (CAPCOA 2022). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of residential buildings and on the default factor of pounds of VOC per building square foot per day.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers using during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of residential surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings and CalEEMod default values, which include 50 grams per liter VOC for residential interior and exterior surfaces. SCAQMD's Rule 1113 (Architectural Coatings) would govern the VOC content for interior and exterior coatings.[3] The CalEEMod default reapplication rate of 10% of area per year is assumed.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per residential dwelling unit per day) and number of summer days (when landscape maintenance would generally be performed) and winter days.

Fugitive VOC emissions from fueling operations were estimated based on the annual throughput and emissions factors from the SCAQMD Risk Assessment Procedures for Rules 1401, 1401.1, and 212 (SCAQMD 2024).

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for greenhouse gas (GHG) emissions in CalEEMod, since criteria pollutant emissions would occur at the site of power plants which are already regulated in terms of criteria air pollutant emissions. These indirect air emissions are not included in the air quality analysis. However, natural gas combustion would occur within the project site itself, in association with equipment that uses natural gas. As such, natural gas use within the project site is estimated and modeled in CalEEMod. For nonresidential buildings, CalEEMod energy intensity values (natural gas usage per square foot per year) assumptions were based on the California Commercial End-Use Survey database. CalEEMod default values for energy consumption assume compliance with the 2019 Title 24 Building Energy Efficiency Standards.

Mobile Sources

Mobile sources for the development scenario would primarily be motor vehicles (automobiles and light-duty trucks) traveling to and from the site. Motor vehicles may be fueled with gasoline, diesel, or alternative fuels. The default vehicle mix provided in CalEEMod 2022, which is based on the California Air Resources Board (CARB) Mobile Source Emissions Inventory model (EMFAC) version 2021, was applied for all land

[3] SCAQMD Rule 1113 includes a 50 grams per liter VOC content limit for both flat and non-flat coatings, which are the most common coatings for interior and exterior paint applications. Accordingly, the CalEEMod default values applied are generally consistent with the air district architectural coating rules.

use types. Emission factors representing year 2027 were used to estimate emissions associated with the final buildout year associated with implementation of the project.

Applied trip generation rates for the buildout development scenario are based on the traffic impact analysis found in Appendix J-1.

Table 4 summarizes the operational emissions criteria pollutants that would be generated from the proposed project. Operational emissions were then compared to the SCAQMD operational thresholds.

Table 4. Estimated Maximum Daily Operational Criteria Air Pollutant Emissions

Emission Source	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
Area	4.17	<0.01	0.11	<0.00	<0.01	<0.01
Energy	<0.01	0.06	0.05	<0.01	<0.01	<0.01
Mobile	13.26	42.37	132.56	0.55	36.97	9.92
Total	**17.43**	**42.43**	**132.72**	**0.55**	**36.97**	**9.92**
SCAQMD Threshold	*55*	*55*	*550*	*150*	*150*	*55*
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Appendix A-1.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.
The values shown are the maximum summer or winter daily emissions results from California Emissions Estimator Model (CalEEMod).
<0.01 = value less than reported 0.01 metric tons per year.

As shown in Table 4, the combined daily area, energy, and mobile source emissions would not exceed the SCAQMD operational thresholds for VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$. In addition, idling vehicles associated with the retail and fueling station would not result in occurrence of CO hotspots due to exceedance of CO health-related air quality standards. A full analysis of CO hotspots is included in Section 3.3(c). Therefore, impacts associated with proposed project-generated operational criteria air pollutant emissions would be less than significant.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact. Air quality varies as a direct function of the type and amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts upon those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions. Sensitive receptors include residences, schools, playgrounds, child-care centers, athletic facilities, long-term health-care facilities, rehabilitation centers, convalescent centers, and retirement homes. The discussion below reviews the significance of emissions within the context of potential impacts to sensitive receptors. Sensitive receptors in the vicinity of the project site include single-family residential uses to the east and northwest of the project site, approximately 1,100 feet from the project site.

Localized Significance Thresholds

The SCAQMD recommends a localized significance threshold (LST) analysis to evaluate localized air quality impacts to sensitive receptors in the immediate vicinity of the project site as a result of construction activities. The impacts were analyzed using methods consistent with those in the SCAQMD's Final Localized Significance Threshold Methodology (SCAQMD 2009). The project site is located in Source Receptor Area 28 (Hemet/San Jacinto Valley). The project construction activities would occur over an almost 4-acre work area; therefore, for the purposes of the LST analysis, emissions thresholds based on a 2-acre site were utilized. This is a conservative approach, as LSTs increase with the size of project site. As mentioned previously, the closest sensitive receptors are residences located 1,100 feet (335 meters) from project site. The closest receptor distance in the SCAQMD LST Methodology is 200 meters (656 feet) which was assumed for this analysis. This is considered conservative as the farther away the receptor is located, the more the LST increases.

Project construction activities would result in temporary sources of on-site criteria air pollutant emissions associated with construction equipment exhaust and dust-generating activities. The maximum daily on-site construction emissions generated during construction of the proposed project is presented in Table 5, and compared to the SCAQMD localized significance criteria for Source Receptor Area 28 to determine whether project-generated on-site construction emissions would result in less than significant impacts.

Table 5. Construction Localized Significance Thresholds Analysis

Year	NO_2	CO	PM_{10}	$PM_{2.5}$
	Pounds per Day (On Site)			
2025	31.64	30.18	21.02	11.36
2026	9.85	12.97	0.38	0.35
Maximum Daily Emissions	**31.64**	**30.18**	**21.02**	**11.36**
SCAQMD LST Criteria	*521*	*6,399*	*75*	*23*
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: Appendix A-1.
Notes: NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District; LST = localized significance threshold.
Localized significance thresholds are shown for a 1-acre project site corresponding to a distance to a sensitive receptor of 25 meters.

As shown in Table 5, proposed construction activities would not generate emissions in excess of site-specific LSTs; therefore, localized project construction impacts would be less than significant.

CO Hotspots

Traffic-congested roadways and intersections have the potential to generate localized high levels of CO. Localized areas where ambient concentrations exceed federal and/or state standards for CO are termed CO "hotspots." CO transport is extremely limited because CO disperses rapidly with distance from the source. Under certain extreme meteorological conditions, however, CO concentrations near a congested roadway or intersection may reach unhealthy levels, affecting sensitive receptors.

Typically, high CO concentrations are associated with severely congested intersections. Projects contributing to adverse traffic impacts may result in the formation of a CO hotspot. Additional analysis of CO hotspot impacts would be conducted if a project would result in a significant impact or contribute to an

adverse traffic impact at a signalized intersection that would potentially subject sensitive receptors to CO hotspots. A detailed CO analysis was conducted in the Federal Attainment Plan for Carbon Monoxide for the SCAQMD's 2003 Air Quality Management Plan. The Wilshire Boulevard/Veteran Avenue intersection is one of the most congested intersections in Southern California with an average daily traffic volume of approximately 100,000 vehicles per day. The Wilshire Boulevard/Veteran Avenue intersection in Los Angeles experienced CO concentrations of 4.6 parts per million, which is well below the 35 parts per million 1-hour CO federal standard.

During construction of the proposed project, construction traffic would affect the intersections near the project site. However, construction activities would be temporary and would not be a source of substantial daily vehicle trips. Regarding long-term mobile-source emissions, the proposed project would generate an average daily traffic volume of 3,693 vehicles per day. As the CO hotspots were not experienced at the Wilshire Boulevard/Veteran Avenue intersection (one of the busiest intersections in the Basin), it can be reasonably inferred that CO hotspots would not be experienced at any intersections within the City of Calimesa near the project site. In addition, as discussed in Section 3.17, Transportation, study area intersections would operate at acceptable levels. Therefore, the proposed project would not generate substantial traffic volumes and impacts related to CO hot spots would be less than significant.

Toxic Air Contaminants

A health risk assessment (HRA) was performed to evaluate potential health risk associated with construction and operation of the project. The following discussion summarizes the dispersion modeling and HRA methodology; supporting construction HRA documentation, including detailed assumptions, is presented in Appendix A-2.

For risk assessment purposes, PM_{10} in diesel exhaust is considered diesel particulate matter (DPM), originating mainly from off-road equipment operating at a defined location for a given length of time at a given distance from sensitive receptors. Less-intensive, more-dispersed emissions result from on-road vehicle exhaust (e.g., heavy-duty diesel trucks). For the construction HRA, the CalEEMod scenario for the project was adjusted to reduce diesel truck one-way trip distances to 0.25 acres to estimate emissions from truck pass-by at proximate receptors (SJVAPCD 2024).

For the operational HRA, there may be DPM emissions from heavy-duty diesel trucks visiting the site as well as fugitive toxic air contaminants (TACs) from vehicle fueling operations. DPM emissions were estimated using CalEEMod and routes provided by Ganddini Group, Inc. (Appendix J-1). The TAC emissions from fueling activities were estimated based on emission factors from SCAQMD (SCAQMD 2024).

The air dispersion modeling methodology was based on generally accepted modeling practices of SCAQMD (SCAQMD n.d.). Air dispersion modeling was performed using the EPA's American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) Version 23132 modeling system (computer software) with the Lakes Environmental Software implementation/user interface, AERMOD View Version 12.0.0. The HRA followed the Office of Environmental Health Hazard Assessment's 2015 guidelines (OEHHA 2015) and SCAQMD guidance to calculate the health risk impacts at all proximate receptors as further discussed below. The dispersion modeling included the use of standard regulatory default options. AERMOD parameters were selected consistent with the SCAQMD and EPA guidance and identified as representative of the project site and project activities. Principal parameters of this modeling are presented in Table 6.

Table 6. American Meteorological Society/Environmental Protection Agency Regulatory Model Principal Parameters – Construction HRA

Parameter	Details
Meteorological Data	AERMOD-specific meteorological data for the Redlands air monitoring station was used for the dispersion modeling. A 5-year meteorological dataset from 2018, 2019, and 2021–2023 was obtained from the SCAQMD in a preprocessed format suitable for use in AERMOD.
Urban versus Rural Option	Urban dispersion option was selected SCAQMD guidelines, which is the SCAQMD policy for all air quality impact analyses in its jurisdiction (SCAQMD 2022).
Terrain Characteristics	The elevation of the site is 2,394 feet above sea level and the surrounding area is predominantly hilly.
Elevation Data	Digital elevation data were imported into AERMOD and elevations were assigned to receptors and emission sources, as necessary. Digital elevation data were obtained through the AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with a resolution of 1 degree (approximately 30 meters [100 feet]), consistent with the SCAQMD guidance (SCAQMD 2022).
Source Release Characterizations	Construction: The modeled line of volume sources was placed to cover the site for exhaust emissions. A plume height dimension of 20 meters (66 feet), a plume width dimension of 20 meters, and a release height of 10 meters (33 feet) were assumed for off-road equipment and diesel trucks (SCAQMD 2008). Operation: The modeled line of volume sources was used to represent diesel truck exhaust running emissions. A plume height dimension of 20 meters, a plume width dimension of 20 meters, and a release height of 10 meters were assumed for diesel trucks (EPA 2024). Loading and breathing emissions from gasoline and E-85 were modeled as point sources with a release height of 3.66 meters (12 feet) and diameter of 0.05 meters (0.16 feet). Refueling, spillage, and hose permeation emissions are modeled as volume sources with horizontal dimensions of 13 meters (43 feet) by 13 meters to correspond to the dimensions of the pump islands, a vertical dimension of 5 meters to correspond to the height of the canopy, and release height of 1 meter (3.3 feet) (SCAQMD 2024).

Source: See Appendix A-2.
Notes: HRA = health risk assessment; AERMOD = American Meteorological Society/Environmental Protection Agency Regulatory Model; SCAQMD = South Coast Air Quality Management District.

Regarding receptors, the construction scenario used a fine cartesian grid of 20-meter (66-foot) spacing was placed over proximate residences to the site. Discrete receptors were also placed on rural residences.

AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the necessary input values for Hotspots Analysis and Reporting Program (HARP2). The line of volume sources was partitioned evenly based on the 1 gram per second emission rate. The ground-level concentration plot files were then used to estimate the long-term cancer health risk to an individual, and the non-cancerous chronic and acute health indices.

Cancer risk is defined as the increase in probability (chance) of an individual developing cancer due to exposure to a carcinogenic compound, typically expressed as the increased chances in one million. Maximum Individual Cancer Risk is the estimated probability of a maximally exposed individual potentially contracting cancer as a result of exposure to TACs over a period of 30 years for residential receptor locations. For the construction HRA, the TAC exposure period was assumed to be from third trimester of pregnancy for 1.08 years for all off-site receptor locations (i.e., the assumed duration of project

construction). For the operational HRA, the TAC exposure period was assumed to be from third trimester of pregnancy for 30 years.

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs since some TACs increase non-cancerous health risk due to long-term (chronic) exposures and some TACs increase non-cancerous health risk due to short-term (acute) exposures. Chronic exposure is evaluated in the construction HRA. Non-carcinogenic risks are quantified by calculating a hazard index, expressed as the ratio between the ambient pollutant concentration and its toxicity or reference exposure level, which is a concentration at or below which health effects are not likely to occur. The chronic hazard index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system. A hazard index less than one (1.0) means that adverse health effects are not expected. Results of the construction HRA are presented in Table 7.

Table 7. Construction Health Risk Assessment Results

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Maximum Individual Cancer Risk – Residential	Per Million	2.9	10	Less than Significant
Chronic Hazard Index – Residential	Index Value	0.003	1.0	Less than Significant

Source: SCAQMD 2024.
Note: CEQA = California Environmental Quality Act.
See Appendix A-2.

As shown in Table 7, project construction activities would result in a Residential Maximum Individual Cancer Risk of 2.9 in 1 million for off-site receptors, which is below the significance threshold of 10 in 1 million. Project construction would result in a Residential Chronic Hazard Index of 0.003 for off-site receptors, which is below the 1.0 significance threshold. The project construction TAC health risk impacts would be less than significant. The results of the operational HRA are shown in Table 8.

Table 8. Operational Health Risk Assessment Results

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Maximum Individual Cancer Risk – Residential	Per Million	1.3	10	Less than Significant
Chronic Hazard Index – Residential	Index Value	0.0004	1.0	Less than Significant
Acute Hazard Index - Residential	Index Value	0.0006	1.0	Less than Significant

Source: SCAQMD 2024.
Note: CEQA = California Environmental Quality Act.
See Appendix A-2.

As shown in Table 8, project operational activities would result in a Residential Maximum Individual Cancer Risk of 1.3 in 1 million for off-site receptors, which is less than the significance threshold of 10 in 1 million. Project operation would result in a Residential Chronic Hazard Index of 0.0004 and a Residential Acute Hazard Index of 0.0006, which is below the 1.0 significance threshold. The project operational TAC health risk impacts would be less than significant.

Health Effects of Criteria Air Pollutants

Construction emissions of the proposed project would not exceed the SCAQMD thresholds for any criteria air pollutants, including VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$.

Health effects associated with O_3 include respiratory symptoms, worsening of lung disease leading to premature death, and damage to lung tissue (CARB 2019). VOCs and NO_x are precursors to O_3, for which the SCAB is designated as nonattainment with respect to the NAAQS and CAAQS. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SCAB due to O_3 precursor emissions tend to be found downwind of the source location because of the time required for the photochemical reactions to occur. Furthermore, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur, because exceedances of the O_3 NAAQS and CAAQS tend to occur between April and October when solar radiation is highest. Due to the lack of quantitative methods to assess this complex photochemistry, the holistic effect of a single project's emissions of O_3 precursors is speculative. That being said, because the proposed project would not exceed the SCAQMD thresholds during construction or operational activities, the project would not contribute to health effects associated with O_3.

Health effects associated with NO_x include lung irritation and enhanced allergic responses (CARB 2019). Because project-related NO_x emissions would not exceed the SCAQMD mass daily thresholds, and because the SCAB is a designated attainment area for nitrogen dioxide (NO_2) and the existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards, it is not anticipated that the proposed project would cause an exceedance of the NAAQS and CAAQS for NO_2 or result in potential health effects associated with NO_2 and NO_x.

Health effects associated with CO include chest pain in patients with heart disease, headache, light-headedness, and reduced mental alertness (CARB 2019). CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots was discussed previously and determined to be less than significant. Thus, the proposed project's CO emissions would not contribute to significant health effects associated with CO.

Health effects associated with PM_{10} include premature death and hospitalization, primarily for worsening of respiratory disease (CARB 2019). The proposed project would result in a temporary increase in fugitive dust emissions during construction activities, when ground disturbance would expose loose soils to wind erosion. Construction of the proposed project would not exceed thresholds for PM_{10} or $PM_{2.5}$, would not contribute to exceedances of the NAAQS and CAAQS for particulate matter, and would not obstruct the SCAB from coming into attainment for these pollutants. The proposed project would also not result in substantial DPM emissions during construction. In addition, the proposed project would be required to comply with SCAQMD Rule 403, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction, the proposed project is not anticipated to result in health effects associated with PM_{10} or $PM_{2.5}$.

In summary, construction and operation of the proposed project would not result in exceedances of the SCAQMD significance thresholds for criteria pollutants, and potential health effects associated with criteria air pollutants would be less than significant.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less Than Significant Impact. The occurrence and severity of potential odor impacts depend on numerous factors. The nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of the receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying, cause distress among the public, and generate citizen complaints.

Construction Emissions

During project construction, exhaust from equipment may produce discernible odors typical of most construction sites. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment. However, such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people.

Operational Emissions

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (SCAQMD 1993). Operation of the project would create odors related to recreational vehicle fueling at the proposed fuel facility. These odors would be temporary and dissipated quickly by regional air movement and localized winds, and no buildup of odors is expected to occur. In addition, the fuel facility would be equipped with Phase I and Phase II controls to be in compliance with CARB and SCAQMD requirements for installing a vapor recovery system to collect gasoline vapors during fuel delivery or fuel storage and vehicle fueling, which would also have a co-benefit for controlling odors. This system will control at least 90% of the fuel vapors typically vented and the associated odors.

3.4 Biological Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES – Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☒	☐	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☒	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☒	☐	☐

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. As such, there would be no permanent physical environmental changes on the northern parcels; therefore, there would be no impacts to biological resources on the northern parcels. It should be noted that pursuant to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) and for the purpose of the Joint Project Review (JPR) process, the Regional Conservation Authority (RCA) required that, in the event of future development, the biological resources and MSHCP consistency analysis cover the entire project site rather than just the proposed Sandalwood Travel Center development project site (Parcel 3). Any future development proposed on the northern parcels would be subject to an updated separate biological resources analysis and associated CEQA process as determined by the City. Should the project footprint that is currently pending JPR consistency findings from RCA change in the future, an Amended JPR process may also be required. The following analysis discusses all three parcels, and is based on the biological resources analysis included in this IS/MND as Appendix B, General Biological Resources Assessment (Assessment).

3.4.1 General Biological Resources Assessment

The biological analysis for the proposed Sandalwood Travel Center development relies on the Assessment prepared by HELIX Environmental Planning (HELIX) in January 2026 (Appendix B). The area studied in the Assessment covers two existing APNs (411-210-006 and 411-210-024) plus an off-site right-of-way and a study buffer for a total 11.2-

acre project site. As part of the Finance Map (TPM 38215), these APNs will ultimately be subdivided into three APNs (identified as Parcels 1, 2, and 3 for the purpose of this IS/MND). No development is currently proposed on Parcels 1 and 2 (the northern parcels) in the central and northern portions of the project site. Although the northern parcels were included as part of the Assessment, the only impacts that would occur are associated with the proposed Sandalwood Travel Center development project in the southern portion of the project site, specifically on Parcel 3.

The Assessment included a review of project plans, a literature review of biological resources occurring on the project site and surrounding vicinity, a general biological survey, including vegetation mapping and a general habitat assessment, a narrow endemic plant species assessment, a burrowing owl (*Athene cunicularia*) (BUOW) habitat assessment and focused burrow protocol surveys, a Crotch's bumble bee (*Bombus crotchii*) (CBB) habitat assessment, and a jurisdictional delineation which included an assessment for an MSHCP riparian/riverine and vernal pool resources.

HELIX searched the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB) (CDFW 2024) and the California Native Plant Society's Inventory of Rare and Endangered Plants (CNPS 2024) to identify special-status biological resources from the region. The CNDDB and the Inventory of Rare and Endangered Plants were searched based on the U.S. Geological Survey 7.5-minute topographic quadrangle map for El Casco and Yucaipa where the project site is located. Prior to beginning fieldwork, aerial photographs (1 inch = 125 feet), topographic maps (1 inch = 125 feet), U.S. Geological Survey quadrangle maps, and National Wetlands Inventory maps (USFWS 2024) were reviewed to assist in determining the location of potential jurisdictional waters on the project site.

The Assessment fieldwork was conducted by HELIX on November 6, 2020, and on December 21, 2020, on Parcel 3 only, to characterize the existing environmental conditions, vegetation communities/land covers, and any plants or wildlife (including their habitats) that could be impacted during the Sandalwood Travel Center development project implementation (i.e., construction and operation). On April 22, 2022, HELIX conducted biological assessment fieldwork on the entire project site. The general biological assessment included vegetation mapping, during which HELIX compiled a general inventory of plant and wildlife species and determined the potential for special-status species to occur specifically within the project site.

The project site is located within two MSHCP-designated survey areas, specifically for narrow endemic plant species and for BUOW. As such, the general biological assessment conducted on November 6, 2020 also included a habitat suitability assessment for narrow endemic plant species and BUOW. The biologist walked the survey area slowly and methodically, closely checking habitat for suitable burrows and owl diagnostic sign (e.g., molted feathers, pellets/castings, or whitewash at or near a burrow entrance). Inaccessible areas of the survey area were visually assessed using binoculars. Per the appropriate survey protocol, MSHCP Burrowing Owl Survey Instructions (RCA 2006), because suitable BUOW habitat was found on the proposed development site (Parcel 3) during the Step I habitat assessment, HELIX extended the assessment buffer out to 150 meters (approximately 500 feet). Furthermore, because suitable habitat was found, HELIX also conducted a Step II-A focused burrow survey on the proposed development site. Similarly, on April 22, 2022, an assessment conducted separately on the northern parcels also included a habitat suitability assessment for narrow endemic plant species and BUOW (Step I), as well as a Step II-A focused burrow survey for BUOW. The BUOW habitat assessment was updated for the entire project site on July 24, 2024, and because one suitable burrow and one surrogate burrow were detected, RCA required that Step II-B focused BUOW surveys be conducted throughout the project site. The first Step II-B focused BUOW survey was conducted concurrently with the Step I habitat assessment and Step II-A burrow survey. Three additional focused BUOW surveys (for a total of four surveys) were conducted. The focused burrow survey and the four BUOW

surveys were conducted by HELIX biologists between July 24 and August 7, 2024, and followed the appropriate methodology (RCA 2006). The BUOW survey results are detailed below and in Appendix B.

HELIX conducted a CBB assessment on July 13, 2024, throughout the entire project site (all three parcels and off-site areas) to determine whether suitable CBB habitat is present. In accordance with CDFW's Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species (CDFW 2023), the biologist mapped habitat alliances within the project site. Habitat alliances were classified following the Manual of California Vegetation (Sawyer et al. 2009). The biologist recorded the estimated absolute percent cover for individual species for each habitat alliance. In addition to foraging resources, potential nesting habitat (e.g., small mammal burrows, loose soil, bunch grasses, thatch, brush piles, old bird nests, and dead trees) were noted if observed during the assessment. The CBB habitat assessment findings are detailed below and in Appendix B.

On May 12, 2021, HELIX conducted a jurisdictional waters assessment on the entire project site on April 22, 2022. Existing conditions were also re-verified during the 2024 BUOW surveys and CBB habitat suitability assessment. The delineation was conducted to identify jurisdictional waters potentially subject to U.S. Army Corps of Engineers (USACE) jurisdiction pursuant to Section 404 of the Clean Water Act (CWA); Regional Water Quality Control Board (RWQCB) jurisdiction pursuant to Section 401 of the CWA and/or state Porter–Cologne Water Quality Control Act; and streambed habitats potentially subject to CDFW jurisdiction pursuant to Sections 1600 et seq. of the California Fish and Game Code. The jurisdictional waters assessment also focused on assessing the project site for MSHCP Riparian/Riverine Areas and vernal pools.

The project site has been used for agriculture since at least 1938 (Historic Aerials 1958). Under prior environmental review and regulatory permits (MND for Rough Grading Permit for a 10-Acre Parcel Located North of Sandalwood Drive on 7th Street (July 2007) State Clearinghouse No. 2007031152), the project site was graded in 2009 for the purpose of implementing a drainage improvement project, but no other work has occurred within the project site since 2009. Because the prior project (2009) received Section 1602 approval from CDFW by Operation of Law, mitigation requirements for impacts to CDFW jurisdiction were likely described in the Notification of Lake or Streambed Alteration. The original landowner is deceased, and the current landowner and CDFW are unable to locate the Notification of Lake or Streambed Alteration to verify the required mitigation for the prior project. Additionally, documentation of mitigation implementation is unable to be located. The prior project also impacted drainages that met the definition of MSHCP Riparian/Riverine Areas; therefore, a Determination of Biologically Equivalent or Superior Preservation (DBESP) and appropriate mitigation would have also been required. A DBESP cannot be located by the landowner, RCA, or the Wildlife Agencies (i.e., CDFW and U.S. Fish and Wildlife Service [USFWS]). Given that mitigation requirements and implementation cannot be verified, the development applicant has coordinated with the landowner, the Wildlife Agencies, and the Rivers and Lands Conservancy and has developed a mitigation approach to compensate for previous project impacts to CDFW jurisdiction and MSHCP Riparian/Riverine Areas. Based on this coordination, an after-the-fact DBESP has also been prepared to demonstrate that the proposed mitigation provides equivalent or superior preservation for prior impacts that occurred on the project site. No mitigation was required by USACE in the Section 404 Nationwide Permit, and RWQCB determined no action would be taken in the Section 401 Water Quality Certification.

The project site has minimal vegetative cover and is dominated by disturbed habitat, specifically wild oats and annual brome grasslands. The site had been disked on a regular basis prior to and during the timeframes of the 2020 fieldwork, but vegetation had regrown by the time the April 2022 fieldwork occurred. The eastern project boundary consists of non-native grassland dominated by slender oat (*Avena barbata*). A small area of ornamental trees was noted in the northeastern corner of the project site, which consisted of Peruvian peppertrees (*Schinus molle*). The western boundary of the project site consists of paved right-of-way associated with 7th Street. Conditions

documented in 2022 were consistent with those observed in 2024. The topography within the project site is mostly flat, with elevations ranging from approximately 2,393 feet (729 meters) above mean sea level near the northwestern portion of the project site to approximately 2,387 feet (728 meters) above mean sea level near the southwestern corner.

A map of the landscape and vegetation communities is depicted on Figure 6, Impacts to Vegetation and Land Cover Types. No special-status plant communities or wetlands or riparian vegetation were observed within the project site. The vegetation is typical for urbanized areas in the region. A total of 29 plant species (9 native and 20 non-native) were recorded within the project site (Appendix B). The dominant presence of non-native species is indicative of the high degree of disturbance as a result of historical and current use of the site.

Wildlife species observed during the field survey were limited to 18 bird species (see Appendix B). These species are typical in an urban and developed setting. Other species expected to occur include coyote (*Canis latrans*), desert cottontail (*Sylvilagus audubonii*), raccoon (*Procyon lotor*), and western fence lizard (*Sceloporus occidentalis*).

3.4.2 MSHCP Consistency Analysis

An MSHCP Consistency Analysis for the Sandalwood Travel Center site was prepared by HELIX in March 2023 and updated in January 2026. The MSHCP Consistency Analysis provides the City, the RCA, CDFW, and USFWS with the information necessary to determine that the proposed project is consistent with the Western Riverside County MSHCP (County of Riverside 2003). Because the proposed project site is located within MSHCP Criteria Cells, the project is subject to the City's Habitat Evaluation and Acquisition Negotiation Strategy process, followed by the JPR process with RCA, CDFW, and USFWS. Although there is no development proposed on the northern parcels, the RCA required that the parcels at least be assessed to ensure that no resources were present that could be affected by development of Parcel 3. The JPR process is currently ongoing. Changes that may come out of the JPR process will be incorporated into the Final MND and prior to project approval. For additional details regarding the MSHCP, refer to Section 3.4.2(f).

Biological Resources Threshold Responses

a) ***Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?***

Less Than Significant Impact with Mitigation Incorporated. Special-status biological resources present or potentially present on the project site (Parcel 3) were identified through a literature search prior to the field surveys conducted in November and December 2020, included in Appendix B. The literature search also covered the northern parcels, which were later assessed in the field in April 2022. Conditions documented in 2022 were consistent with those observed in 2024. The literature search concluded that there are no special-status plant or wildlife species with a moderate or high potential to occur.

None of the 20 rare plant species previously recorded (per literature and database searches) within the vicinity of the project site were considered to have potential to occur on the project site based on geographic range, elevation range, and/or lack of suitable habitat (Appendix B). Therefore, no impacts to rare plant species would occur.

Of the 28 sensitive animal species recorded within the vicinity of the project site, 23 species were considered to have no potential to occur within the project site due to the lack of suitable habitat. Based on the habitat assessment, HELIX determined there is no suitable CBB habitat within the project site; therefore, this species does not have a potential to occur. There is a limited quantity and diversity of nectar resources on the project site, a lack of known occurrences in adjacent areas, and limited potential nesting habitat and it was concluded that surveys were not warranted. No significant impacts to these 24 sensitive wildlife species are anticipated. However, 4 of the 28 sensitive special-status wildlife species in the vicinity of the project site have a low potential to occur on the project site, as shown in Table 9. For the reasons described in Table 9, these species are not expected to occur on or adjacent to the project site. With the payment of the MSHCP fee, no additional mitigation is required for potential impacts to these 5 species.

Table 9. Special-Status Wildlife Species Potential to Occur

Scientific Name Common Name	Status [a, b, c]	Habitat	Potential to Occur[d]
Buteo swainsoni Swainson's hawk	ST; MSHCP Covered Species	Breeds in open grassland with scattered trees or groves within agricultural/ ranchlands. Forages for small mammals, reptiles, birds, and insects in adjacent grassland and agricultural fields.	**Low**. This species is not known to nest in southern California, except for populations in the Antelope Valley and Mojave Desert. Undeveloped land on the project site could provide low-quality foraging habitat, although only one mammal burrow was observed on the project site. This species was recorded in eBird in 2017, approximately 2.7 miles to the northeast of the project site.
Elanus leucurus white-tailed kite	SFP; MSHCP Covered Species	Nests in trees with dense canopies within open grasslands, woodlands, and marshes. Forages for small mammals within lightly grazed/ungrazed pastures and grasslands.	**Low**. The project site supports a few Peruvian pepper trees (*Schinus molle*) that could be used for nesting habitat, although this is considered low-quality nesting habitat because these trees are directly adjacent to I-10. Undeveloped land on the project site could provide low-quality foraging habitat, although only one mammal burrow was observed on the project site. This species was recorded in eBird in 2018, approximately 0.4 miles to the southeast of the project site.
Lanius ludovicianus loggerhead shrike	SSC; MSHCP Covered Species	Nests in dense, often thorny, shrubs or trees. Will nest within brush piles or tumble weeds when trees or shrubs are not present. Feeds on a wide variety of animals, including arthropods, amphibians, reptiles, small mammals, and small songbirds within	**Low**. The project site does not support suitable nesting habitat. Undeveloped land on the project site could provide low-quality foraging habitat. This species was recorded in eBird in 2015, approximately 2.3 miles to the southwest of the project site.

Table 9. Special-Status Wildlife Species Potential to Occur

Scientific Name Common Name	Status [a, b, c]	Habitat	Potential to Occur[d]
		open habitats such as grasslands, agricultural fields, pastures, shrublands, and ruderal areas with adequate perching locations.	
Bombus crotchii Crotch's bumble bee	CESA Candidate	Coastal California east to the Sierra–Cascade crest and south into Mexico and is associated with grassland and scrub habitats near the coast. Nests are underground and commonly consist of abandoned rodent nests.	**None**. Based on the limited quantity and diversity of nectar resources on the project site, a lack of known occurrences within adjacent areas, and limited potential nesting habitat, the project site does not contain suitable habitat.
Athene cunicularia burrowing owl	CESA Candidate; MSHCP Covered Species[c]	Typical habitat is grasslands, open scrublands, agricultural fields, and other areas where there are ground squirrel burrows or other areas in which to burrow.	**Absent.** The project site supports suitable habitat, including one suitable burrow and one surrogate burrow. Focused surveys were conducted during the 2024 breeding season, and results were negative.
Perognathus longimembris brevinasus Los Angeles pocket mouse[e]	SSC; MSHCP Covered Species[c]	Sandy, gravelly, or stony soils within coastal scrub, alluvial sage scrub, and grassland habitats.	**Low**. The project site supports a small area of non-native grassland along the eastern Parcel 3 boundary. Only one small mammal burrow was observed on the project site. This species was recorded in CNDDB in 2016, approximately 4.9 miles to the southeast of the project site.

Source: Appendix B.
Notes:

[a] Sensitive species reported within the El Casco and Yucaipa quadrangles based on a database search conducted on CNDDB.
[b] SFP – State Fully Protected; SSC – State Species of Special Concern; CESA Candidate – California Endangered Species Act Candidate for listing as Threatened or Endangered; MSHCP Conditionally Covered Species (c) surveys may be required for species within locations shown on survey maps.
[c] BCC = USFWS Bird of Conservation Concern; FE = Federally Listed–Endangered; ST = State Listed – Threatened
[d] Low potential to occur is assessed as follows: Suitable habitat is present on the project site but of low quality and/or small extent. The species has not been recorded recently on or near the project site. Although the species was not observed during surveys for the current project, the species cannot be excluded with certainty.
[e] Los Angeles pocket mouse is a conditionally covered species, and surveys are required for those projects within a Mammal Species Survey Area. However, because the project site is not located within a survey area, surveys are not required for this species.

Although the project site supports a small area of non-native grassland along the eastern Parcel 3 boundary, the project site is not located within an MSHCP-designated survey area for mammals. Therefore, no further action regarding Los Angeles pocket mouse, including focused surveys, is warranted or required.

Focused surveys for BUOW were conducted in accordance with the accepted survey protocol (RCA 2006). Because one suitable burrow and one surrogate burrow were observed within the survey area, three additional focused BUOW surveys (for a total of four surveys) were conducted in July and August 2024. No BUOW or other sign was observed within the survey area, and the BUOW was determined to be absent from the project site. Although BUOW does not currently occupy the project site, a pre-construction survey is still required because of the presence of suitable habitat conditions and to address any potential of BUOW moving into the project site prior to construction. Implementation of **Mitigation Measure (MM) BIO-1** (Pre-Construction Burrowing Owl) within 30 days prior to ground disturbance pursuant to the MSHCP is required to confirm that conditions have not changed prior to construction.

In addition, there is a potential for birds to nest on the project site. All migratory bird species that are native to the United States or its territories are protected under the federal Migratory Bird Treaty Act (MBTA), as amended under the Migratory Bird Treaty Reform Act of 2004 (70 FR 12710). The MBTA is generally protective of migratory birds, but does not actually stipulate the type of protection required. In common practice, the MBTA is used to place restrictions on the disturbance of active bird nests during the nesting season. Development of the proposed project could disturb or destroy active migratory bird nests, including eggs and young. Disturbance to, or destruction of, migratory bird eggs, young, or adults is in violation of the MBTA, and is considered a potentially significant impact. Similarly, nesting birds are protected under the California Fish and Game Code. Although suitable habitat for nesting birds on the project site is limited, herbaceous ground cover and trees located in the northeastern portion of the project site could provide habitat for protected nesting bird species. **MM BIO-2** (Nesting Birds) would be implemented to ensure that the project complies with MBTA and California Fish and Game Code regulations.

Implementation of these measures would ensure that impacts to any species with a potential to occur on the project site, including nesting birds or BUOW that could potentially move onto the project site, are less than significant.

Mitigation Measures

MM BIO-1 Pre-Construction Burrowing Owl. Prior to the commencement of ground-disturbing activities (e.g., earthwork, vegetation clearing, grubbing, site watering, equipment and vehicle staging) on the project site, a pre-construction survey for burrowing owl (BUOW) shall be conducted by a qualified biologist within 30 days prior to ground disturbance to determine the presence of BUOW. If the pre-construction survey is negative and burrowing owl is confirmed absent, then ground-disturbing activities shall be allowed to commence, and no further action is required. If construction is inactive for more than 30 days, a pre-construction survey must be conducted again to confirm BUOW has not colonized the project site since it was last disturbed.

If BUOW is observed during the pre-construction survey, the project proponent shall immediately notify the Regional Conservation Authority (RCA) and the Wildlife Agencies (i.e., collectively, California Department of Fish and Wildlife and U.S. Fish and Wildlife Service). All active burrows and owls shall be avoided with, at a minimum, establishment of an appropriately sized exclusion buffer, under the oversight of a qualified biologist, to ensure there would be no direct or indirect impacts to BUOW. The project proponent shall also coordinate with the RCA and the Wildlife Agencies to determine whether preparation of a BUOW Protection and Relocation Plan is necessary.

MM BIO-2 Nesting Birds. Construction activities (e.g., earthwork, vegetation clearing, grubbing, site watering, and equipment and vehicle staging) at the Sandalwood Travel Center development project site shall occur outside of the general bird nesting season for migratory birds. The general nesting season is February 15 through August 31 for songbirds and January 15 through August 31 for raptors.

If construction activities (e.g., earthwork, vegetation clearing, grubbing, site watering, and equipment and vehicle staging) must occur during the general bird nesting season for migratory songbirds (February 15 through August 31) and raptors (January 15 through August 31), a qualified biologist shall conduct a pre-construction survey of potential nesting habitat to confirm the absence of active nests belonging to migratory birds and raptors afforded protection under the Migratory Bird Treaty Act and California Fish and Game Code. The pre-construction survey shall be performed no more than seven days prior to the commencement of construction activities. If construction is inactive for more than seven days, an additional survey shall be conducted. The results of the pre-construction survey shall be documented by the qualified biologist.

If the qualified biologist determines that no active migratory bird or raptor nests occur, the activities shall be allowed to proceed without any further action. If the qualified biologist determines that an active nest is present, an exclusion buffer shall be established. No impacts within the 300-foot (500-foot for raptors) exclusion buffer shall occur until the young have fledged the nest and the qualified biologist has confirmed the nest is no longer active. The biological monitor may modify (decrease or increase) the buffer size and/or propose other recommendations in order to ensure that nesting birds are not disturbed.

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

No Impact. The Sandalwood Travel Center (Parcel 3) would permanently impact approximately 4.5 acres and temporarily impact 0.4 acres (Table 10, Impacts to Vegetation and Land Uses; Figure 6, Impacts to Vegetation and Land Cover Types). None of these vegetation communities observed on the project site is characterized as sensitive pursuant to local, regional, state, or federal regulations. Furthermore, no development is proposed on the northern parcels of the project site. In addition, there is no riparian vegetation present in any of the three parcels. Therefore, no impacts to sensitive vegetation communities would occur, and no mitigation is warranted.

Table 10. Impacts to Vegetation and Land Uses

Manual of California Vegetation/Oberbauer	Permanent Impacts (Acres)[1]			Temporary Impacts (Acres)[1]		
	On-Site	Off-Site	Total	On-Site	Off-Site	Total
Wild Oats and Annual Brome Grassland	3.7	0.3	**4.0**	0.1	0.3	**0.4**
Developed	0.0	0.2	**0.2**	0.0	<0.1[2]	**<0.1**
Disturbed	0.0	0.2	**0.2**	0.0	<0.1[3]	**<0.1**

Table 10. Impacts to Vegetation and Land Uses

Manual of California Vegetation/Oberbauer	Permanent Impacts (Acres)[1]			Temporary Impacts (Acres)[1]		
	On-Site	Off-Site	Total	On-Site	Off-Site	Total
Pepper Tree Grove	0.1	0.0	**0.1**	0.0	<0.1[4]	**0.0**
Total	**3.8**	**0.7**	**4.5**	**0.1**	**0.3**	**0.4**

Source: Appendix B.
Notes: Acreages may vary from project description information provided above because they are based on field measurements rather than CAD or civil survey data.
1 Acreages are rounded to the nearest 0.10 acres.
2 Actual acreage is 0.01 acres.
3 Actual acreage is 0.01 acres.
4 Actual acreage is 0.03 acres.

c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less Than Significant Impact with Mitigation Incorporated. For the currently proposed project, a jurisdictional assessment was conducted by HELIX on May 12, 2021, on Parcel 3 and on April 22, 2022, on the northern parcels. Existing conditions were also reverified during the 2024 BUOW surveys and CBB habitat suitability assessment. No jurisdictional waters regulated by the USACE, RWQCB, or CDFW or Riparian/Riverine Areas pursuant to the MSHCP occur within the project boundary. Storm drain inlets are in the northern and central portions of the project site, and function to accept sheet flow from 7th Street; 7th Street is a paved road and bounds the project site to the west. No jurisdictional indicators were observed associated with these inlets. Photographs of the existing storm drain inlets on the project site are provided in the General Biological Resources Assessment (Appendix B).

No federally defined waters of the United States or state occur within the project site. This includes the absence of federally defined wetlands and other waters (e.g., drainages) and state-defined waters (e.g., streams and riparian extent). The project would be subject to the typical restrictions (e.g., best management practices [BMPs]) and requirements that address erosion and runoff, including those of the CWA and National Pollutant Discharge Elimination System (NPDES) permit. With implementation of BMPs and permit conditions, no indirect impacts would occur.

Although no state or federal wetlands or other regulated waters or MSHCP Riparian/Riverine Areas are currently present on the project site, it should be noted that fieldwork conducted prior to the 2009 grading determined that the site historically supported three ephemeral streambeds, also classified as MSHCP Riparian/Riverine Areas, specifically one stream in the northern portion of the project site (Stream) and two drainages (Drainage 1 and 2). These areas totaled 1.12 acres and were filled and replaced with a sub-surface storm drain system in 2009. Because mitigation requirements and implementation cannot be verified, the development applicant has coordinated with the landowner, the Wildlife Agencies, and the Rivers and Lands Conservancy to identify an approach to compensate for prior project impacts to MSHCP Riparian/Riverine Areas. A DBESP has been prepared to address after-the-fact consistency of the prior project (2009) with MSHCP Section 6.1.2 and is also part of the currently ongoing JPR process. **MM BIO-3** requires that the project ensure that the previously required mitigation is implemented accordingly, as well as being reviewed and approved by RCA and the Wildlife Agencies as part of the JPR process. Therefore, this impact would be less than significant with mitigation incorporated.

Mitigation Measures

MM BIO-3 CDFW Jurisdiction and MSHCP Riparian/Riverine Areas. In order for the project to fully demonstrate consistency with the Multiple Species Habitat Conservation Plan, and prior to preparation of the Final Mitigated Negative Declaration (MND) document, the Joint Project Review (JPR) process with the City of Calimesa, Regional Conservation Authority (RCA), and Wildlife Agencies (i.e., collectively, California Department of Fish and Wildlife and U.S. Fish and Wildlife Service) shall be completed, including their review and approval of the Determination of Biologically Equivalent of Superior Preservation (DBESP) Report.

The JPR process is ongoing, and the final results of the JPR process, including relevant comments from the RCA and the Wildlife Agencies, shall be described in the Final MND, as applicable. Any changes to the proposed compensatory mitigation approach detailed in the DBESP, as required by RCA and Wildlife Agency comments, shall also be updated in the Final MND.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less Than Significant Impact. Wildlife movement corridors, also referred to as dispersal corridors or landscape linkages, are generally defined as linear features along which animals can travel from one habitat or resource area to another and may also provide live-in habitat conditions.

The project site is not located within any designated wildlife movement corridors, nor does it encompass any features that would support fish or native wildlife nursery site. Furthermore, the site is not directly connected to any movement corridors or large blocks of habitat. The project site consists mostly of undeveloped land dominated by disturbed habitat with sparse vegetation. The proposed project site is surrounded by existing or approved development on all sides.

In addition, the project site is not identified by the MSHCP as being part of a local or regional corridor or designated Linkage. The nearest Linkage to the project site is Proposed Constrained Linkage (PCL) 23, which is approximately 0.25 miles to the south of the project site. The project site does not directly connect to PCL 23, and is separated by Sandalwood Drive and an existing commercial development. Some wildlife species may use the project site for local foraging and/or nesting; however, use of the project site by wildlife is restricted due to limited vegetative cover and adjacent disturbance from existing human development (Appendix B). Therefore, impacts related to interference with wildlife movement, established wildlife corridors, or use of native wildlife nursery sites would be less than significant.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

No Impact. The project site does not support any oak trees or other trees protected by City policies or ordinances. Therefore, the project would not conflict with Chapter 18.80, Tree Preservation, of the City's Municipal Code and no impact would occur.

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Less Than Significant Impact with Mitigation Incorporated. The project site is located within Subunit 2 (Badlands/San Bernardino National Forest) in the north-central portion of the Pass Area Plan. The following discussion provides information demonstrating that there are no conflicts with the MSHCP. Note that in order for the Sandalwood Travel Center development project to participate in the MSHCP, the development applicant is required to pay a fee to finance the acquisition of conservation areas that provide habitat for MSHCP covered species. The fee must be paid to the City prior to the issuance of a building permit, and the City transfers MSHCP fees to the RCA.

Given that the proposed project is located within the MSHCP Criteria Area, the project is required to undergo a Habitat Assessment and Negotiation Strategy to determine what portion (if any) of the project site must be included as part of the MSHCP Conservation Area in order to meet the Cell conservation goals. An MSHCP Consistency Analysis Report was prepared and submitted to the City (August 2022), along with a Habitat Assessment and Negotiation Strategy application, followed by the City initiating the JPR process with the RCA in September 2022. The development applicant is working to respond to JPR comments from RCA, which includes submitting an after-the-fact DBESP. After RCA issues their consistency findings, the Wildlife Agencies (i.e., CDFW and USFWS) will perform their own joint review, including review of the DBESP, and provide their comments or concurrence with RCA's findings. Per the City's direction, the JPR processing, including RCA and Wildlife Agency approval of the DBESP, will be completed before the Final MND is prepared.

Reserve Assembly

The MSHCP Plan Area is divided into 16 Area Plans, which are further subdivided into Area Plan subunits. The project site is located within Subunit 2 (Badlands/San Bernardino National Forest) in the north-central portion of the Pass Area Plan. The northern, northeastern, and western portions of the project site fall within the northeastern corner of Cell 323, and the southern and southeastern portions of the project site fall within the west-central portion of Cell 326. Because the project site does not encompass areas described for conservation, it is anticipated that the project will not conflict with the conservation goals described for Cells 323 and 326.

MSHCP Section 6.1.2 Riparian/Riverine Areas and Vernal Pools

The identification of MSHCP Riparian/Riverine resources is based on the potential for the habitat to support, or be a tributary to habitat that supports, Riparian/Riverine Covered Species. Riparian/Riverine Covered Species are identified in MSHCP Section 6.1.2. The MSHCP defines Riparian/Riverine habitat as "lands which contain Habitat dominated by trees, shrubs, or emergent mosses and lichens, which occur close to, or which depend upon, soil moisture from a nearby fresh water source; or areas with freshwater flow during all or a portion of the year." The MSHCP defines Vernal Pools as "seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season." Artificially created wetlands, except for those created intentionally to provide habitat or resulting from the creation of open waters or alteration of natural stream courses, are not considered MSHCP Vernal Pools.

Based on prior fieldwork (pre-2009), the Sandalwood Travel Center Project site historically supported three Riparian/Riverine Areas, specifically one stream in the northern portion of the project site (Stream) and two drainages (Drainage 1 and 2) in the center of the site. These areas totaled 1.12 acres and were filled and replaced with a sub-surface storm drain system in 2009. Refer to discussion in Section 3.4(c) regarding how these previous impacts to MSHCP Riparian/Riverine Areas have been retroactively addressed.

In accordance with the MSHCP, a Riparian/Riverine and Vernal Pool habitat assessment was conducted for the project site by HELIX on May 12, 2021, and for the entire project site on April 22, 2022. No Riparian/Riverine Areas or Vernal Pools were observed within the project site boundary. Storm drain inlets are in the northern and central portions of the project site, which function to accept sheet flow from 7th Street; 7th Street is a paved road that bounds the project site to the west. Neither Riparian/Riverine Areas nor Vernal Pools were observed associated with these inlets. No depressional areas capable of supporting fairy shrimp species were observed within the project site. As a result, the project site does not support Riparian/Riverine Areas or Vernal Pools or suitable habitat for associated species, as defined by the MSHCP. The project site does not support suitable habitat for MSHCP riparian/riverine bird species, including least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), and yellow-billed cuckoo (*Coccyzus americanus*). Therefore, focused surveys were not required. No evidence of hydric soils (e.g., mud cracks), vernal pool/wetland vegetation, or vernal pool/wetland hydrology were observed on the project site during the 2020 or 2021 site visits or during the 2022 or 2024 site visits. The northern parcel photographs (Photographs 5 through 8 in Appendix D of the Biological Resources Assessment [Appendix B of this IS/MND]) were taken immediately after a rain event. The soils on the project site do not consist of clay or silt and are dominated by well-drained loam and sandy loam. Because there were no signs of hydric soils, vernal pool/wetland vegetation, or vernal pool/wetland hydrology observed during the habitat assessment, suitable fairy shrimp habitat is presumed absent from the project site and focused surveys were not warranted. Therefore, the proposed development project will not directly impact Riparian/Riverine Areas, vernal pools, or associated species, and does not conflict with MSHCP Section 6.1.2.

MSHCP Section 6.1.3 Narrow Endemic Plant Species

The entire project site (all three parcels) is located within a Narrow Endemic Plant Species Survey Area (NEPSSA), specifically NEPSSA 8, which requires a habitat assessment for Yucaipa onion (*Allium marvinii*) and many-stemmed dudleya (*Dudleya multicaulis*). These species are generally associated with clay soils within upland habitats. Many-stemmed dudleya can also occur on sandstone outcrops. A habitat assessment for these two species was conducted on the project site during a general biological survey on November 6, 2020, and a habitat assessment for these two species was conducted on the northern parcels during a general biological survey on April 22, 2022. The project site does not support habitat for Yucaipa onion or many-stemmed dudleya due to the absence of clay soil and sandstone outcrops. The project site mostly supports loamy and sandy soil types. The project site is also located below the elevation range of Yucaipa onion. Given that the project site does not support suitable habitat for either species, focused surveys for narrow endemic plant species were not warranted, and the proposed project would not conflict with Section 6.1.3 of the MSHCP.

MSHCP Section 6.1.4 Urban/Wildland Interface Guidelines

Proposed developments adjacent to MSHCP Conservation Areas may create edge effects that can impact conserved biological resources. The MSHCP provides guidelines that address potential indirect effects from

proposed developments that are in proximity to MSHCP Conservation Areas. These guidelines include measures addressing the quantity and quality of runoff generated by the development (i.e., drainage and toxics), night lighting, noise, non-native invasive plant species, barriers to humans and animal predators, and grading/land development encroachment. The project site is located within Cells 323 and 326, but not within the portions of the Cells described for conservation or located adjacent to existing or described MSHCP Conservation Areas. PCL-23 is located approximately 0.25 miles south of the project site. Given that the proposed development is separated from PLC-23 by Sandalwood Drive and existing commercial development to the south, as well as surrounded by existing or approved development on all other sides, MSHCP Section 6.1.4 does not technically apply to the proposed project. Nevertheless, the development project is committed to following Urban/Wildland Interface Guidelines and as standard practice, the development applicant would implement the following BMPs as part of the proposed project. The proposed project does not conflict with MSHCP Section 6.1.4.

Drainage

The project site does not support any drainages. However, the proposed development project would incorporate BMPs to avoid the discharge of untreated surface runoff that could in any way make its way to any downstream waters. BMPs would include those required for construction pursuant to the State Water Resources Control Board General Construction Stormwater Permit and those required post-construction pursuant to the NPDES and Municipal Storm Drain requirements. The development project has been designed to prevent the release of toxins, chemicals, petroleum products, exotic plant materials, or other elements that might degrade or harm biological resources or ecosystem processes downstream from the project. In addition, post-construction BMPs are intended to help ensure that post-project hydrologic conditions remain consistent with pre-project conditions, thereby minimizing the potential for downstream erosion and/or sedimentation that could otherwise result from implementation of the proposed project.

Toxics

Land uses that use chemicals or generate bio-products that are potentially toxic or may adversely affect wildlife species, habitat, or water quality shall incorporate BMPs to ensure that the application of such chemicals does not result in discharge into downstream waters. As standard practice, BMPs such as those implemented to address drainage issues would also result in avoidance of potential impacts relative to toxics.

Lighting

Temporary construction lighting and ambient lighting from any proposed development project is required to be selectively placed, directed, and shielded away from any MSHCP Conservation Areas. The proposed project site is not located near enough to PCL-23 to the south to cause lighting-related impacts.

Noise

As standard practice, wildlife would not be subject to noise that would exceed residential noise standards, and the proposed project site is not located near enough to PCL-23 to the south to cause noise-related impacts. Nevertheless, temporary short-term construction-related noise impacts would be reduced by the construction contractor implementing a number of BMPs, including the following:

- All construction activities will occur during the daylight hours. The construction contractor shall limit all construction-related activities that would result in high noise levels according to the construction hours to be determined by the City.

- During all excavation and grading, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards to reduce construction equipment noise to the maximum extent possible. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest to the project site.
- The construction contractor shall stage equipment in areas that will create the greatest distance between construction-related noise sources and noise sensitive receptors nearest to the project site during all construction.
- The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment. To the extent feasible, haul routes shall not pass through sensitive land uses or residential dwellings.

Invasives

Although the proposed project is located 0.25 miles from the nearest Conservation Area (PCL-23), there is still a potential for wind and water to transfer invasive plant material to these areas. The development project would not use invasive plants for erosion control, landscaping, wind rows, or other purposes. Specifically, no species listed in MSHCP Table 6-2, Plants that Should Be Avoided Adjacent to the MSHCP Conservation Area, would be used in the project landscape plans (including not in the hydroseed mix used for interim erosion control), as stated in **MM BIO-4**.

Barriers

Because the project site is not located directly adjacent to the MSHCP Conservation Area, barriers and related signage are not necessary.

Grading/Land Development

The project site is not adjacent to an MSHCP Conservation Area. All grading would occur within the proposed project footprint and would not extend into any MSHCP Conservation Area.

MSHCP Section 6.3.2 Additional Surveys

The project site is not located within a Criteria Area Species Survey Area for plant species nor located within an amphibian or mammal survey area. As such, no further action, including a habitat suitability assessment or focused surveys are required for these species. No impacts to Criteria Area Species Survey Area plant species or sensitive amphibians or mammal species are anticipated.

As discussed above, although BUOW does not currently occupy the project site, a pre-construction survey is still required because of the presence of suitable habitat conditions and to address any potential of BUOW moving into the project site prior to construction. Implementation of **MM BIO-1** within 30 days prior to ground disturbance pursuant to the MSHCP is required to confirm that conditions have not changed prior to construction.

The proposed project does not conflict with MSHCP Section 6.3.2.

Other Applicable Plans

The project site is not subject to any other adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan. The project site is not located within the Stephens' Kangaroo Rat (SKR) Habitat Conservation Plan, including not located within any of the SKR Habitat Conservation Plan Core Reserves (Riverside County Habitat Conservation Agency 1996). Therefore, the development project is not required to pay an SKR mitigation fee for incidental take authorization under the SKR Habitat Conservation Plan. The need for SKR take is not anticipated; however, if needed, SKR is covered under the MSHCP.

In addition to **MM BIO-1**, **MM BIO-2**, and **MM BIO-3** discussed above, implementation of the following measure would ensure that any conflicts with the MSHCP would be less than significant:

MM BIO-4 MSHCP Landscape Plan Restrictions. In accordance with MSHCP Section 6.1.4, no species listed in Table 6-2, Plants that Should be Avoided Adjacent to the MSHCP Conservation Area, shall be used in the project landscape plans (including hydroseed mix used for interim erosion control).

3.5 Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
V. CULTURAL RESOURCES – Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☒	☐	☐

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, there would be no impacts relative to cultural resources on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate cultural resources analysis and CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3, based, in part, on the Cultural Resources Survey Report, included as Appendix C to this IS/MND.

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

Less Than Significant Impact. The Eastern Information Center (EIC) at the University of California, Riverside was contacted on December 3, 2020, to assist in the identification of historical resources within the Sandalwood Travel Center development project area and a 0.5-mile radius. Due to COVID-19, the EIC

reduced their staff and changed their record search policies and procedures. As such, not all available data known to EIC may have been provided. The results of the EIC record search were completed and received on March 22, 2021, and include the bibliographic data relating to the resources and previous studies conducted within the EIC search area and copies of any reports or site forms that are located within the EIC search area. However, the map illustrating the location of the resources and previous studies was omitted from the public record search data.

The EIC records indicated that 19 previous cultural resource studies have been conducted within 0.5 miles of the development project site, including one study that overlaps the development project site. Based on the results of the previous studies, six cultural resources have been previously recorded within 0.5 miles of the development project site with one located within the proposed development area (Table 11). There are three wooden utility poles dating from 1940 to 1950 (P-33-015300) that would be undergrounded as a part of the project. Two historic resources, which include a historic isolate consisting of two glass bottle fragments that date from 1880 to 1914 and a scattering of porcelain plate fragments that were too small to be dated (P-33-015299), are located outside of the development footprint but within proximity to the project. The remaining four resources consist of historic sites associated with rural residences, agricultural, and farming activities located west of I-10 to the north and south of the project site.

Table 11. Previously Recorded Cultural Resources Within a 0.5-Mile Radius of the Project Site

Primary (P-33-##)	Trinomial	Resource Age and Type	Resource Description	Recording Events	Proximity to Project Site	NRHP Eligibility
013993	—	Historic Site	Historic site with a water retention feature	2005 (Laurie S. White)	Outside	Not Addressed
013995	—	Historic; Site	Historic site containing a structural foundation	2005 (Laurie S. White)	Outside	Not Addressed
015299	—	Historic; Isolate	Two sun-colored amethyst glass fragments; Dates back from 1880 to 1914	2005 (Koral Ahmet)	Outside	Not Addressed
015300	—	Historic; Site	Nine wooden utility poles	2005 (Koral Ahmet)	Inside	Ineligible
016792	—	Historic; Building	Single-family residence, detached garage, and a wood barn.	2006 (Ben Taniguchi, Laura Gellegos, and Christeen Taniguichi)	Outside	Not Addressed
016793	—	Historic; Building	Two-story vernacular farmhouse, a secondary two-story vernacular barn/residence, a wooden chicken coop, and a corrugated metal barn	2006 (Ben Taniguchi, Laura Gellegos, and Christeen Taniguichi)	Outside	Not Addressed

Note: NRHP = National Register of Historic Places.

In addition to the EIC records search, a pedestrian survey of the project site was conducted on February 16, 2021, by HELIX and a Native American monitor from the Morongo Band of Mission Indians. The previously recorded scattering of porcelain plate fragments (P-33-015299) were not reidentified during the pedestrian survey. The nine wooden utility poles (P-33-015300) were observed. Of the nine poles, only three poles are within the project site and are proposed to be removed in order to underground utility lines. One of the three poles proposed to be removed is of historic age; however, this pole from an individual perspective is not considered a sensitive resource. The pole is a contributor to a historic alignment, but the Cultural Resources Survey Report concluded that the impacts to this pole would not alter the historic alignment. No other cultural resources were observed during the pedestrian survey.

Based on the results of the Cultural Resources Survey Report, development of the proposed project would not cause a substantial adverse change in the significance of a historical resource, and impacts would be less than significant.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Less Than Significant Impact with Mitigation Incorporated. As described in Section 3.5(a), the records search conducted for the development project identified six cultural resources, all of which pertain to the historic era, have been previously recorded within 0.5 miles of the development project site. However, one of the six historic resources is recorded within the project site, as discussed above. This one site (P-33-015300) does not meet the criterion to be considered a significant archaeological resource pursuant to Section 15064.5.

An archaeological pedestrian survey of the project site was conducted on February 16, 2021, by HELIX and a Native American monitor from the Morongo Band of Mission Indians. During the survey, all portions of the project site were inspected for cultural resources residing on the surface; however the project site was overlain by low-lying vegetation that inhibited ground visibility. During the survey, no cultural material was observed within the project site. The previously recorded scattering of porcelain plate fragments (P-33-015299) that were previously recorded adjacent to the project site were not reidentified during the pedestrian survey. Nine wooden utility poles (P-33-015300) were observed. Of the nine poles, only three poles are within the project site and are proposed to be removed in order to underground utility lines. One of the three poles proposed to be removed is of historic age; however, this pole from an individual perspective is not considered a sensitive resource. The pole is a contributor to a historic alignment, but the Cultural Resources Survey Report concluded that impacts to this pole would not alter the historic alignment. No other cultural resources were observed during the pedestrian survey. Refer to Section 3.18 for information on Tribal cultural resources (TCRs).

Despite the lack of evidence of archaeological resources within the project site, there is still a potential that subsurface ground-disturbing activities during construction could encounter resources present below the surface. In the event that previously unknown archaeological materials are uncovered during construction, potentially significant impacts to archaeological resources may occur. Therefore, **MM CUL-1** is proposed (refer below) and would be implemented to address the potential for encountering previously unknown archaeological materials during construction. With implementation of **MM CUL-1**, impacts to archaeological resources would be less than significant.

Mitigation Measures

MM CUL-1 Prior to issuance of the grading permit, the grading plan notes shall be verified by the City to include the following requirements:

Prior to any vegetation clearing, demolition, or ground disturbance, a qualified archaeologist shall be retained and on-call to respond and address any inadvertent discoveries identified during initial excavation in native soil. Initial excavation is defined as initial construction-related earth moving of sediments from their place of deposition. As it pertains to archaeological monitoring, this definition excludes movement of sediments after they have been initially disturbed or displaced by project-related construction. A qualified archaeological principal investigator, meeting the Secretary of the Interior's Professional Qualification Standards, should oversee and adjust monitoring efforts as needed (increase, decrease, or discontinue monitoring frequency) based on the observed potential for construction activities to encounter cultural deposits or material. The archaeological monitor will be responsible for maintaining daily monitoring logs.

In the event that cultural resources (sites, features, or artifacts) are exposed during construction activities for the project, all construction work occurring within 60 feet of the find shall cease and a qualified archaeologist meeting the Secretary of Interior Standards must be notified immediately to assess the significance of the find and determine whether or not additional study is warranted. Work on the other portions of the project outside the buffered area may continue during this assessment period. In addition, the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) Cultural Resources Department shall be contacted, as detailed within MM TCR-1, regarding any pre-contact and/or historic-era finds and be provided information after the archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regards to significance and treatment.

If the find is less than significant per the California Environmental Quality Act (CEQA) Guidelines Section 15064.5.5, the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under CEQA Guidelines Section 15064.5 and significant impacts cannot be avoided, the archaeologist shall prepare a cultural resources Monitoring and Treatment Plan, the drafts of which shall be provided to the San Manuel Band of Mission Indians Cultural Resources Department (SMBMI) and the City for review and comment as detailed in MM TCR-1. The City reserves the right to submit the Monitoring and Treatment Plan to appropriate Tribes for their review. Once the City has approved the Monitoring and Treatment Plan, it shall be implemented under the oversight of a qualified archaeological principal investigator. All subsequent finds shall be subject to this Monitoring and Treatment Plan. This Monitoring and Treatment Plan may allow for a Tribal monitor to be present during construction, under the oversight of the qualified archaeologist. Should more than one Tribe request Tribal monitoring, the Tribal monitors will be subject to a rotational schedule with one Tribal monitor on site during any activities that result in subsurface disturbance.

When monitoring is conducted, an archaeological monitoring report shall be prepared within 60 days following completion of ground disturbance and submitted to the City

for review. This report should document compliance with approved mitigation, document the monitoring efforts, and include an appendix with daily monitoring logs. The final report shall be submitted to the South Coastal Information Center (SCIC) and interested Tribes, if requested.

c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact with Mitigation Incorporated. The discovery of human remains is always a possibility during ground disturbance. The State of California Health and Safety Code Section 7050.5, CEQA Guideline 15064.5(e), and California Public Resources Code (PRC) Section 5097.98 mandate the process to be followed in the unlikely event of an accidental discovery of any human remains in a location other than a dedicated cemetery. Specifically, in accordance with PRC 5097.98, the Riverside County Coroner must be notified within 24 hours of the discovery of potential human remains. The Coroner must then determine within two working days of being notified if the remains are subject to his or her authority. If the Coroner recognizes the remains to be Native American, he or she must contact the Native American Heritage Commission (NAHC) by phone within 24 hours, in accordance with PRC 5097.98. The NAHC then designates a Most Likely Descendant (MLD) with respect to the human remains within 48 hours of notification. The MLD would then have the opportunity to recommend to the development applicant means for treating or disposing, with appropriate dignity, the human remains and associated grave goods within 24 hours of notification. This requirement is incorporated as **MM CUL-2**, in order to provide standard procedures in the event that human remains are encountered during proposed construction of the development project. Therefore, impacts to human remains would be less than significant with mitigation incorporated.

Mitigation Measures

MM CUL-2 Prior to issuance of the grading permit, the grading plan notes shall be verified by the City to include the following requirements:

In accordance with Section 7050.5 of the California Health and Safety Code, if potential human remains and funerary objects are found, earth-disturbing work in the vicinity (100-foot [30.5-meter] buffer area) shall immediately halt, and the County Coroner shall be notified of the discovery. The Coroner will provide a determination within 48 hours of notification. No further excavation or disturbance of the identified material, or any area reasonably suspected to overlie additional remains, shall occur until a determination has been made. If the County Coroner determines that the remains are, or are believed to be, Native American, they shall notify the Native American Heritage Commission (NAHC) within 24 hours. In accordance with California Public Resources Code Section 5097.98, the NAHC must immediately notify those persons believed to be the most likely descendant (MLD) from the deceased Native American. The MLD may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American human remains and may recommend to the owner or the person responsible for the excavation work, the means for treatment or disposition, with appropriate dignity, of the human remains and any associated grave goods. The MLDs shall complete their inspection and make recommendations or preferences for treatment within 48 hours of being granted access to the site.

3.6 Energy

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VI. Energy – Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, there would be no impacts relative to energy on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate energy analysis and CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the air quality modeling results included as Appendix A-1 to this IS/MND.

a) ***Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?***

Less Than Significant Impact. The short-term construction and long-term operation of the proposed development project will require the consumption of energy resources in several forms at the project site and within the project area. Construction and operational energy consumption are evaluated in detail below.

Electricity

Construction Use

Temporary electric power for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers would be provided by Southern California Edison (SCE). The electricity used for such activities would be temporary and would have a negligible contribution to the project's overall energy consumption. No impact would occur.

Operational Use

Project operation would require electricity for multiple purposes including building heating and cooling, lighting, appliances, and electronics. For building consumption, default electricity consumption rates in California Emissions Estimator Model (CalEEMod) for the proposed project land uses and climate zone were used. Building operations for the project would involve energy consumption for multiple purposes including, but not limited to, building heating and cooling, lighting, and electronics, as well as parking lot lighting. Building operations, including parking lot lighting, would consume approximately 97,815 kilowatt hours per year of electricity (Appendix A-1). For comparison, non-residential electricity demand for Riverside County

in 2019 was 8,183 million kilowatt hours (CEC 2021a). The proposed development project would result in a negligible increase in electricity consumption. Impacts related to operational electricity use would therefore be less than significant.

Natural Gas

Construction Use

Natural gas is not anticipated to be required during construction of the proposed development project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed below under the "petroleum" subsection. Any minor amounts of natural gas that may be consumed as a result of project construction would have a negligible contribution to the project's overall energy consumption. No impact would occur.

Operational Use

Natural gas consumption during operation would be required for various purposes, including building heating and cooling and cooking. For building consumption, default natural gas generation rates in CalEEMod for the proposed development project land uses and climate zone were used. Building operations would consume an estimated 223,708 kilo-British thermal units per year of natural gas (Appendix A-1). For comparison, in 2019 approximately 148.2 million therms (148.2 billion kilo-British thermal units) of natural gas were delivered to Riverside County non-residential customers (CEC 2021b). The proposed development project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains additional energy measures that are applicable to proposed development project under the California Green Building Standards Code (CALGreen). As such, impacts related to operational natural gas use would be less than significant.

Petroleum

Construction Use

Heavy-duty construction equipment associated with construction activities would rely on diesel fuel, as would haul and vendor trucks involved in delivery of materials to the development project site. Construction workers would travel to and from the development project site throughout the duration of construction. It is assumed in this analysis that construction workers would travel to and from the site in gasoline-powered light-duty vehicles.

Heavy-duty construction equipment of various types would be used during each phase of the development project construction. Appendix A-1 lists the assumed equipment usage for each phase of construction. Fuel consumption from construction equipment was estimated by converting the total carbon dioxide (CO_2) emissions from each construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon (The Climate Registry 2025). The estimated diesel fuel usage from construction equipment is shown in Table 12.

Table 12. Construction Equipment Diesel Demand

Phase	Pieces of Equipment	Equipment CO_2 (MT)	Kg CO_2/Gallon	Gallons
Site Preparation	7	12.01	10.21	1,176.30
Grading	7	10.74	10.21	1,051.81
Building Construction	9	250.10	10.21	24,495.20
Paving	8	11.02	10.21	1,079.33
Architectural Coating	1	1.09	10.21	106.76
			Total	**27,909.40**

Sources: Pieces of equipment and equipment CO_2 (Appendix A-1); kg CO_2/gallon (The Climate Registry 2025).
Notes: CO_2 = carbon dioxide; MT = metric ton; kg = kilogram.

Fuel estimates for total worker, vendor, and haul truck fuel consumption are provided in Table 13.

Table 13. Construction Worker, Vendor, and Haul Truck Petroleum Demand

Phase	Trips	Vehicle MT CO_2	Kg CO_2/ Gallon	Gallons
Worker Vehicles (Gasoline)				
Site Preparation	90	0.54	8.78	61.01
Grading	128	0.76	8.78	86.77
Building Construction	15,640	91.19	8.78	10,385.76
Paving	360	2.10	8.78	239.18
Architectural Coating	252	1.47	8.78	167.43
			Total	**10,940.15**
Vendor Trucks (Diesel)				
Site Preparation	20	0.28	10.21	27.19
Grading	32	0.44	10.21	43.49
Building Construction	6,440	88.03	10.21	8,621.45
Paving	72	0.98	10.21	95.98
Architectural Coating	72	0.98	10.21	95.98
			Total	**8,884.09**
Haul Trucks (Diesel)				
Site Preparation	0	0.00	10.21	0.00
Grading	608	19.01	10.21	1,861.90
Building Construction	0	0.00	10.21	0.00
Paving	0	0.00	10.21	0.00
Architectural Coating	0	0.00	10.21	0.00
			Total	**1,861.90**

Sources: Trips and vehicle CO_2 (Appendix A-1); kg CO_2/gallon (The Climate Registry 2025).
Notes: MT = metric ton; CO_2 = carbon dioxide; kg = kilogram.

In summary, construction of the development project is conservatively anticipated to consume approximately 10,940 gallons of gasoline and 38,655 gallons of diesel over a period of approximately 13 months. For comparison, approximately 20 billion gallons of petroleum will likely be consumed in California

over the course of the proposed project's construction phase, based on the California daily petroleum consumption estimate of approximately 78.6 million gallons per day (EIA 2017). Overall, because petroleum use during construction would be temporary, and would not be wasteful or inefficient, impacts would be less than significant.

Operational Use

The fuel consumption resulting from the development project's operational phase would be attributable to employees and visitors traveling to and from the project site. Petroleum fuel consumption associated with motor vehicles traveling to and from the project site during operation is a function of vehicle miles traveled (VMT). As shown in Appendix A-1, the annual VMT attributable to the development project is expected to be 19,047,169 VMT per year. Similar to construction worker and truck trips, fuel consumption for operation is estimated by converting the total CO_2 emissions from VMT to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Based on the default CalEEMod vehicle mix and the countywide proportion of gasoline and diesel on-road vehicle VMT, the vehicles associated with the development project operations would likely be approximately 93% gasoline powered and 7% diesel powered vehicles. The estimated fuel use from vehicles traveling to and from the project site during operation is shown in Table 14.

Table 14. Project Operations – Petroleum Consumption

Fuel	Vehicle MT CO_2	Kg CO_2/Gallon	Gallons
Gasoline	4,862.23	8.78	553,784.77
Diesel	4,419.27	10.21	432,837.13

Source: Appendix A-1.
Notes: CO_2 = carbon dioxide; kg = kilogram; MT = metric ton.

As depicted in Table 14, development project operation would result in approximately 986,622 gallons of petroleum fuel usage per year. This is a conservative estimate since it does not account for usage of electric vehicles. By comparison, California as a whole consumes approximately 28.7 billion gallons of petroleum per year (EIA 2017).

Over the lifetime of the project, the fuel efficiency of vehicles is expected to increase. As such, the amount of petroleum consumed as a result of vehicular trips to and from the project site during operation is expected to decrease over time. There are numerous regulations in place that require and encourage increased fuel efficiency, such as efforts to accelerate the number of plug-in hybrids and zero-emissions vehicles in California and increasingly stringent emissions standards (CARB 2013). As such, operation of the development project is expected to use decreasing amounts of petroleum over time due to advances in fuel economy. Impacts related to operational petroleum use would therefore be less than significant.

In summary, although the project would increase energy use, the use would be a small fraction of the statewide use, and due to efficiency increases, is expected to diminish over time (particularly with respect to petroleum). Given these considerations, energy consumption associated with the project would not be considered inefficient or wasteful and would result in a less than significant impact.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. The proposed development project would be subject to state regulations for energy efficiency, namely, California's Building Energy Efficiency Standards and CALGreen, both of which

are set forth in the California Code of Regulations, Title 24. California's Building Energy Efficiency Standards were established in 1978 and serve to enhance and regulate California's building standards. These standards include regulations for residential and nonresidential buildings constructed in California to reduce energy demand and consumption. The Building Energy Efficiency Standards are updated periodically (every 3 years) to incorporate and consider new energy efficiency technologies and methodologies. CALGreen institutes mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential, and state-owned buildings, as well as schools and hospitals. The 2016 CALGreen standards became effective on January 1, 2017. The new 2019 standard became effective on January 1, 2020. The proposed project would meet Building Energy Efficiency Standards and CALGreen standards to reduce energy demand and increase energy efficiency.

At a regional level, the proposed development project would be subject to the policies set forth in SCAG's 2020 RTP/SCS. The RTP/SCS is a regional growth-management strategy that targets per-capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region pursuant to Senate Bill (SB) 375. In addition to demonstrating the region's ability to attain and exceed the GHG emission-reduction targets set forth by CARB, the 2020 RTP/SCS outlines a series of actions and strategies for integrating the transportation network with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. Thus, successful implementation of the 2020 RTP/SCS would result in more complete communities with a variety of transportation and housing choices, while reducing automobile use. With regard to individual developments, such as the development project, the strategies and policies set forth in the 2020 RTP/SCS include improved energy efficiency. The 2020 RTP/SCS goal is to actively encourage and create incentives for energy efficiency, where possible. As discussed previously, the project would comply with the 2019 CALGreen standards. For these reasons, the proposed project would be consistent with the SCAG 2020 RTP/SCS.

The proposed development project would follow applicable energy standards and regulations during construction. In addition, the proposed project would be built and operated in accordance with all existing, applicable regulations at the time of construction. As such, the proposed project would not conflict with existing energy standards and regulations and impacts would be less than significant.

3.7 Geology and Soils

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VII. GEOLOGY AND SOILS – Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to	☐	☐	☐	☒

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Division of Mines and Geology Special Publication 42.				
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, there would be no impacts relative to geology or paleontological resources on the northern parcels. Any future development proposed on the northern parcels would be subject to separate analyses and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the Geotechnical Investigation Report, included as Appendix D to this IS/MND, and the Paleontological Resources Record Search, included as Appendix E.

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

No Impact. The City of Calimesa is located with Southern California, a known seismically active area. California's Alquist–Priolo Earthquake Fault Zoning Act of 1972 prohibits cities from issuing development permits for sites located within an earthquake fault zone. There are no known active

fault traces in the project vicinity. The closest known active fault is the San Jacinto fault, located approximately 5.7 miles west of the development project site, nor is it within the boundary of a Special Studies Zone (Earthquake Fault Zone) (Appendix D). Therefore, no impact would occur.

ii) Strong seismic ground shaking?

Less Than Significant Impact. Based on the proximity of several dominant active faults and seismogenic structures, as well as the historic seismic record, the area of the subject site is considered subject to relatively high seismicity. The seismic hazard most likely to impact the site is ground-shaking due to a large earthquake on one of the major active regional faults. The nearest faults to the project site are associated with the San Jacinto Fault and the San Andreas Fault system, located approximately 5.7 and 6.1 miles from the site, respectively. These faults are anticipated to be capable of producing a maximum 7.9 and 8.2 magnitude earthquake, respectively (Appendix D).

Although the development project site is expected to experience moderate to severe ground shaking, the proposed project would be designed and constructed in a manner that reduces the risk of seismic hazards (Title 24, California Code of Regulations). The proposed development project would be conditioned to comply with the most current seismic design coefficients, ground motion parameters, and all applicable provisions of the California Building Code. In addition, the proposed project would be designed and constructed consistent with all recommendations set forth in the Geotechnical Investigation conducted for the proposed project (Appendix D). Thus, seismic ground shaking impacts would be less than significant.

iii) Seismic-related ground failure, including liquefaction?

Less Than Significant Impact. Ground failure and liquefaction can potentially occur during an earthquake-induced ground-shaking event and can be a main cause of structure damage. Soil liquefaction is a state of soil particles suspension caused by a complete loss of strength when the effective stress drops to zero. Primary factors that trigger liquefaction are as follows: moderate to strong ground shaking (seismic source), relatively clean, loose granular soils (primarily poorly graded sands and silty sands), and saturated soil conditions (shallow groundwater).

The soils encountered within the depth of 34.5 feet on the development project site consisted predominantly of loose to dense silty sand with various amounts of clay, clayey sand, and poorly graded sand with silt; and very stiff to hard sandy silt with various amounts of clay, clayey silt with various amounts of sand, silty clay with various amounts of sand, and sandy clay. Low to very low cohesion strength is associated with the sandy soil. No groundwater was encountered during the field exploration (Appendix D). In addition, the development project site is located within a low liquefaction potential area (County of Riverside 2019), which is consistent with the liquefaction analysis included in Appendix D. Thus, liquification impacts would be less than significant.

iv) Landslides?

No Impact. Areas at risk from landslides include locations on or close to steep hills and steep road cuts or excavations, or areas where existing landslides have previously occurred. The development project site and surrounding area are on relatively flat ground devoid of steep slopes. Due to the

absence of significant slopes on or in the vicinity of the project site, the potential for slope failure that could affect the development project site is negligible. No impact related to landslides would occur.

b) Would the project result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. During construction of the proposed development project, soils would be disrupted during grading activities, exposure of uncovered soils, thereby increasing the potential for wind or water-related erosion and sedimentation until the construction is completed. During construction activities, contractors would be required to comply with federal, state, and local requirements and guidelines to minimize the potential for soil erosion, including the NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities, 2009-0009-DWQ, as amended by 2010-0014-DWQ (General Construction Permit) and each jurisdiction's stormwater permit. A Stormwater Pollution Prevention Plan (SWPPP) would be prepared, outlining BMPs to minimize stormwater pollution resulting from erosion and sediment migration from the construction areas. In addition, the proposed development project must comply with SCAQMD Rule 403, through application of BMPs, to minimize fugitive dust from the project site. Compliance with applicable federal, state, and local regulations would ensure soil erosion, primarily during ground-disturbing construction activities, does not result in substantial loss of topsoil. Thus, soil erosion impacts would be less than significant.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Less Than Significant Impact.

Off-Site Landslide: Refer to response to Section 3.7(a)(iv).

Lateral Spreading: Lateral spreading is a phenomenon in which soils move laterally during seismic shaking, and is often associated with liquefaction. The amount of movement depends on the soil strength, duration and intensity of seismic shaking, topography, and free-face geometry. Due to the relatively flat site topography and low potential for liquefaction, the likelihood of lateral spreading would be low at the development project site. Thus, lateral spreading impacts would be less than significant.

Subsidence: Based on site subsurface conditions and the seismicity of the region, any loose granular materials at the development site could be vulnerable to surface settlement during a seismic event. In addition, the development project site is located within a susceptible subsidence potential area (County of Riverside 2019), but there are no known subsidence issues in the immediate project vicinity (Appendix D). Ground surface total settlements due to compression in the unsaturated zone are estimated to be on the order of 0.19 inches. Differential settlement is estimated to be approximately 0.1 inches. Although the development project site is susceptible to subsidence, the proposed project would be designed and constructed in a manner that reduces the risk of structure failure due to soil instability (Title 24, California Code of Regulations). The proposed development project would be conditioned to comply with the most current seismic design coefficients, ground motion parameters, and all applicable provisions of the California Building Code. In addition, the proposed development project would be designed and constructed consistent with all recommendations set forth in the Geotechnical Investigation conducted for the proposed project (Appendix D). Thus, surface settlement impacts would be less than significant.

Liquefaction and Collapse: Refer to response to Section 3.7(a)(iii).

Based on the existing soil conditions and the analyses conducted for the Geotechnical Investigation (Appendix D), the proposed project would not be located on an unstable geologic unit and impacts would be less than significant.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less Than Significant Impact. Soils encountered within the development project site during the geotechnical investigation consisted predominantly of loose to dense silty sand with various amounts of clay, clayey sand, and poorly graded sand with silt; and very stiff to hard sandy silt with various amounts of clay, clayey silt with various amounts of sand, silty clay with various amounts of sand, and sandy clay. The clay content present within the on-site soils have water storage capabilities. When the soil absorbs water it can expand, followed by potential compression when it dries out. Excessive expansion and compression of soil can cause damage to the structures it supports. Laboratory testing of on-site soils concluded that the soils have minimal potential for collapse and expansion.

Although the on-site soils have low potential for expansion and compression, the proposed development project would be designed and constructed consistent with all recommendations set forth in the Geotechnical Investigation (Appendix D) to minimize risk of expansion/compression and avoid damage to proposed structures. The proposed development project would also comply with the California Building Code, which outlines specific design, engineering, and development standards for structures proposed in areas with unstable and expansive soils. Compliance with current regulations and implementation of recommendations set forth in the Geotechnical Investigation would ensure that proposed structures would be designed and engineered to withstand the impacts of expansive and unstable soils. Impacts related to expansive soils would be less than significant.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Impact. The use of septic tanks or other alternative wastewater disposal systems would not be a part of the proposed development project; no impact would occur.

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less Than Significant Impact with Mitigation Incorporated. The project development area is underlain by Quaternary old alluvial fan deposits (unit 2; map unit Qof_2) as mapped by Matti et al. (2015). These sedimentary deposits are middle to late Pleistocene (774,000 to 11,700 years old) in age and are comprised of silt, sand, and gravel deposited by fluvial processes (Matti et al. 2015; Cohen et al. 2021). Pleistocene, or Ice Age, deposits are considered to have moderate to high paleontological resources sensitivity and have yielded significant paleontological resources elsewhere in Riverside County (Jefferson 1991).

According to the museum records search conducted by the Natural History Museum of Los Angeles County (LACM), nearby fossil localities LACM VP (Vertebrate Paleontology) 7618 to 7622 produced Pleistocene

megafaunal remains, including fossil specimens of horse (*Equidae*) and camel (*Camelidae*) (Appendix E) (LACM 2021). Additional localities (LACM VP 1715 and 1107) near the San Jacinto River, approximately 9 miles east of Hemet, yielded a fossil specimen of horse (*Equus bautistensis*) and other unspecified vertebrates. Locality LACM VP 4540 from the northeastern side of the San Jacinto Valley, due west of Jack Rabbit Trail, yielded the remains of an extinct horse, *Equus*. Locality LACM VP 1269, located at the west end of the Indio hills, produced a fossil horse (*Equus*) specimen. Localities LACM VP 1653 and LACM IP 437, located north of the Soboba Indian Reservation, yielded invertebrates, including insect (*Sobobapteron kirkbaye*) and brachiopod (*Terebratalia hemphili*) specimens, as well as fish (*Squatina* and *Gasterosteus*). At the nearby El Casco Substation, Pleistocene age mammalian fossils were discovered during construction excavations by SCE, and included a saber-toothed cat, horse, panther, llamas, sloth, a new species of deer, and many different types of rodents (Sears 2010).

According to previous assessments in this area (Kennedy and Wirths 2015; Sanka 2006; Leslie 2004), discoveries have been common in San Timoteo Badlands, ever since the initial discoveries made by Frick (1921), and more recently according to studies by Albright (2000). However, due to the minor amount of ground disturbance (less than approximately 6,000 cubic yards of cut) for the Sandalwood Travel Center, the potential for impacts to paleontological resources would be low.

No paleontological resources were identified within the development project area as a result of the institutional records search or desktop geological review. If intact paleontological resources are located on site, ground-disturbing activities associated with construction of the project, such as grading during site preparation, have the potential to destroy a unique paleontological resource or site. Given the proximity of past fossil discoveries in the surrounding area and potential for underlying, Pleistocene-age old alluvial deposits, the project area is highly sensitive for paleontological resources. **MM GEO-1** shall be implemented to avoid impacts to subsurface paleontological resources. Paleontological impacts of the proposed development project would be less than significant with mitigation incorporated.

Mitigation Measures

MM GEO-1 Paleontological Resources. Prior to commencement of any grading activity in areas of moderate to high paleontological sensitivity, the development applicant shall retain a qualified paleontologist per the Society of Vertebrate Paleontology (SVP) (2010) guidelines. The paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) for the project. The PRIMP shall be consistent with the SVP (2010) guidelines and shall outline requirements for preconstruction meeting attendance and worker environmental awareness training, where monitoring is required within the project area based on construction plans and/or geotechnical reports, procedures for adequate paleontological monitoring and discoveries treatment, and paleontological methods (including sediment sampling for microvertebrate fossils), reporting, and collections management. The qualified paleontologist shall attend the preconstruction meeting and a paleontological monitor shall be on-site during rough grading and other significant ground-disturbing activities in areas of previously undisturbed, moderate, and/or high paleontological resources sensitivity. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor will temporarily halt and/or divert grading activity to allow recovery of paleontological resources. The area of discovery will be roped off with a 50-foot radius buffer. Once documentation and collection of the find is completed in accordance with the SVP (2010) guidelines, the monitor will

remove the rope and allow grading to recommence in the area of the find. Collected significant paleontological resource materials shall be conveyed to the Western Science Center in Hemet for curation at the expense of the development applicant. Prior to the issuance of occupancy permits, a final paleontological monitoring letter detailing the monitoring program and including geological and paleontological observations, daily monitoring logs, identification of any significant finds, documentation of curation, if needed, and shall be provided to the City of Calimesa and the Western Science Center if fossils are curated.

3.8 Greenhouse Gas Emissions

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VIII. GREENHOUSE GAS EMISSIONS – Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, there would be no impacts relative to GHG emissions on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate GHG emissions analysis and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the air quality modeling results included as Appendix A-1 to this IS/MND.

The greenhouse effect is a natural process that contributes to regulating the Earth's temperature, and it creates a livable environment on Earth. Human activities that emit additional GHG emissions to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise. Global climate change is a cumulative impact; a project contributes to this impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. Thus, GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008).

As defined in California Health and Safety Code Section 38505(g) for purposes of administering many of the state's primary GHG emissions reduction programs, GHGs include CO_2, methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons, sulfur hexafluoride, and nitrogen trifluoride. The three GHGs evaluated for GHG emission impacts are CO_2, CH_4, and N_2O. HFCs, perfluorocarbons, sulfur hexafluoride, and nitrogen trifluoride were not evaluated or estimated in this analysis because the proposed development project would not generate them in measurable quantities.

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Gases in the atmosphere can contribute to climate change both directly and indirectly.[4] The Intergovernmental Panel on Climate Change developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e).

Construction Emissions

Less Than Significant Impact. Construction of the development project would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road vendor and haul trucks, and worker vehicles. As previously stated, SCAQMD recommends that construction emissions be amortized over a 30-year project lifetime. The CalEEMod was used to estimate GHG emissions during construction as discussed in Section 3.3, Air Quality. Construction of the development project is anticipated to last up to 13 months. Table 15 shows the estimated annual GHG construction emissions associated with the proposed development project, as well as the annualized construction emissions over a 30-year project life.

Table 15. Estimated Annual Construction Greenhouse Gas Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
2025	62.59	0.00	0.00	63.91
2026	428.14	0.01	0.02	434.34
			Total	498.25
			Annualized emissions over 30 years	16.61

Source: Appendix A-1.
Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.

As shown in Table 15, the estimated total GHG emissions during construction would be approximately 498 MT CO_2e over the construction period. Estimated development project-generated construction emissions annualized over 30 years would be approximately 17 MT CO_2e per year. As with project-generated construction air pollutant emissions, GHG emissions generated during construction of the proposed project would be short term in nature, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions. As there is no construction GHG threshold, the amortized construction emissions were added to the operational emissions and evaluated therein.

Operational Emissions

Less Than Significant Impact. Emissions from the operational phase of the project were estimated using CalEEMod Version 2022.1.1.29. Operational year 2027 was assumed consistent with completion of project construction. The project-generated operational GHG emissions from area sources (landscape maintenance), energy sources (natural gas and electricity), mobile sources, refrigerants, solid waste, and water supply and wastewater treatment were evaluated. Emissions from each category are discussed in

[4] Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2017).

the following text with respect to the project. For additional details, see Section 3.3 for a discussion of operational emission calculation methodology and assumptions, specifically for area, energy (natural gas), and mobile sources.

Area Sources

CalEEMod was used to estimate GHG emissions from the project's area sources, which include operation of gasoline-powered landscape maintenance equipment, which produce minimal GHG emissions, and natural gas fireplaces. See Section 3.3 for a discussion of landscaping equipment emissions calculations.

Energy Sources

The estimation of operational energy emissions was based on CalEEMod land use defaults and total area (i.e., square footage) of the project's land uses. At a minimum, the project will comply with Title 24 2019 standards. It should be noted that the Title 24 2022 standards are applicable for projects being constructed after January 1, 2023, and are more stringent than the 2019 standards; therefore, overall emissions under Title 24 2022 standards would be lower than 2019 standards. As such, the quantification of GHG emissions from energy sources contained in this section are conservative.

CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt hour) for SCE is based on the value for SCE's energy mix in 2019. SB 100 calls for further development of renewable energy, with a target of 44% by 2024, 52% by 2027, and 60% by 2030. Because SCE is striving to meet the 60% Renewables Portfolio Standard by December 31, 2030, the CO_2 emissions intensity factor is anticipated to be less than assumed in CalEEMod at full buildout from implementation of the project (2027, first year of project operations), which would reflect the increase in percentage of renewable energy in SCE's energy portfolio.

Mobile Sources

All details for criteria air pollutants discussed in Section 3.3 are also applicable for the estimation of operational mobile source GHG emissions.

Regulatory measures related to mobile sources include Assembly Bill (AB) 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles determined by CARB to be vehicles that are primarily used for non-commercial personal transportation in the state. In addition, the National Highway Traffic Safety Administration and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the project's motor vehicles. The effectiveness of fuel economy improvements was evaluated by using the CalEEMod emission factors for motor vehicles in 2027 to the extent it was captured in EMFAC 2021. The Low Carbon Fuel Standard calls for a 10% reduction in the "carbon intensity" of motor vehicle fuels by 2021, which would further reduce GHG emissions.

Refrigerants

CalEEMod was utilized to estimate fugitive GHG emissions from refrigerants used for air conditioning and refrigeration equipment. Different types of refrigeration equipment are utilized for different types of land uses and CalEEMod generates default refrigerant values based on land use subtype and industry data from the EPA. CalEEMod quantifies refrigerant emissions from leaks during regular operation and routine servicing over the equipment lifetime and then derives average annual emissions from the lifetime estimate but does not quantify emissions from the disposal of refrigeration and air conditioning equipment at the end of its lifetime.

Most of the refrigerants used today are HFCs or blends thereof, which can have high GWP values. However, California is required to reduce HFC emissions 40% below 2013 levels by 2030 under SB 1383, and regulations have been adopted to place GWP limits on HFCs, such as SB 120. While CalEEMod default refrigerant values were assumed for the land use surrogate of commercial research and development land use, it is anticipated to be conservative.

Solid Waste

The project would generate solid waste and, therefore, would result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values for solid waste generation were used to estimate GHG emissions associated with solid waste. Project compliance with statewide solid waste diversion goals, including the 75% diversion rate by 2020 consistent with AB 341 (25% increase from the solid waste diversion requirements of AB 939, Integrated Waste Management Act), would reduce project-generated GHG emissions associated with solid waste disposal. No diversion above the CalEEMod default assumptions was assumed.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the project require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the project requires the use of electricity for conveyance and treatment, along with GHG emissions generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use and associated electricity consumption from water use and wastewater generation were estimated using CalEEMod default values.

Estimated annual operation emissions of the proposed development project are shown in Table 16.

Table 16. Estimated Annual Operational Greenhouse Gas Emissions (2027)

Emissions Source	CO_2	CH_4	N_2O	CO_2e[a]
	Metric Tons per Year			
Area	0.05	0.00	0.00	0.05
Energy	27.23	0.00	0.00	27.35
Mobile	9,281.49	0.29	0.86	9,557.30
Refrigerants	0.00	0.00	0.00	19.85
Solid Waste	2.07	0.21	0.00	7.24
Water and Wastewater	1.82	0.04	0.00	2.96
			Total	9,614.75

Table 16. Estimated Annual Operational Greenhouse Gas Emissions (2027)

Emissions Source	CO_2	CH_4	N_2O	CO_2e[a]
	Metric Tons per Year			
Amortized Construction Emissions				*16.61*
Total with Construction Emissions				**9,631.36**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
[a] Numbers may not sum precisely due to rounding.

The City of Calimesa Climate Action Plan (City of Calimesa 2014c) does not include an adopted threshold for GHG emissions. For CEQA purposes, the City is responsible for selecting an appropriate significance criterion, based on substantial evidence. In guidance drafted by the SCAQMD GHG CEQA Significance Threshold Working Group, SCAQMD considered the following tiered approach to determine the significance of GHG emissions from residential and commercial projects (SCAQMD 2010):

- Tier I – Exemptions, e.g., categorical, statutory, etc.
- Tier II – Consistency with a locally adopted GHG reduction plan
- Tier III – Numerical Screening Thresholds (10,000 MT CO_2e for industrial projects and 3,000 MT CO_2e for non-industrial projects)
- Tier IV – Service Population Screening Threshold

Tier III was determined to be the most appropriate approach for the proposed project because the City of Calimesa has not adopted a significance threshold for GHG emissions (City of Calimesa 2014c). As such, the numerical threshold of 10,000 MT CO_2e per year for industrial project was used as the significance threshold in this analysis.

As shown in Table 16, the proposed development project would result in 9,615 MT CO_2e per year during operation. When the amortized construction emissions are included, the total project operational emissions would be 9,631 MT CO_2e per year. As such, the proposed project would not exceed the industrial threshold of 10,000 MT CO_2e per year as established by the SCAQMD. In addition, the development applicant would be required to include the minimal energy efficiency and water conservation measures to the proposed development project, as required for small projects in the Climate Action Plan (CAP). Impacts would be less than significant.

b) Would the project generate conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less Than Significant. The proposed development project would result in less than significant impacts related to conflicts with GHG emission reduction plans, for the reasons described below.

Consistency with the City of Calimesa Climate Action Plan

The City of Calimesa CAP was adopted in September 2014 (City of Calimesa 2014c). The City of Calimesa CAP includes measures and goals set forth in order to reduce GHG emissions and meet the City's 2020 and 2035 goals. The reduction targets for 2020 and 2035 are based on 15% and 49% decreases from the City's 2010 baseline emissions inventory, which was approximately 69,249 MT CO_2e. The reduction

measures are categorized by source category (transportation, energy efficiency, renewable energy, and solid waste). As discussed in Section 3.8(a), construction of the proposed project would not exceed the threshold of 10,000 MT CO_2e per year. The proposed development project would result in approximately 9,631 MT CO_2e operational GHG emissions. In addition, the development applicant would be required to include the minimal energy efficiency and water conservation measures to the proposed development project, as required for small projects in the CAP. Therefore, the proposed development project would not conflict with the City of Calimesa CAP.

Consistency with CARB's Scoping Plan

The CARB Scoping Plan, approved by CARB in 2008 and updated in 2014, 2017, and 2022, provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. The Scoping Plan is not directly applicable to specific projects, nor is it intended to be used for project-level evaluations.[5] Under the Scoping Plan, however, there are several state regulatory measures aimed at the identification and reduction of GHG emissions. CARB and other state agencies have adopted many of the measures identified in the Scoping Plan. Most of these measures focus on area source emissions (e.g., energy usage, high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low Carbon Fuel Standard), among others.

Consistency with the SCAG 2016–2040 RTP/SCS

SCAG's 2020 RTP/SCS is a regional growth-management strategy that targets per-capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region. The 2020 RTP/SCS incorporates local land use projections and circulation networks in city and county general plans. The 2016 RTP/SCS is not directly applicable to the proposed project because the purpose of the 2020 RTP/SCS is to provide direction and guidance by making the best transportation and land use choices for future development. The proposed development project would not conflict with implementation of the strategies identified in the 2020 RTP/SCS that would reduce GHG emissions.

Consistency with Executive Order S-3-05, Senate Bill 32, and Executive Order B-55-18

The proposed project would not impede the attainment of the GHG reduction goals for 2030 or 2050, as identified in Executive Order (EO) S-3-05 and SB 32. EO S-3-05 establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. While there are no established protocols or thresholds of significance for that future year analysis, CARB forecasts that compliance with the current Scoping Plan puts the state on a trajectory of meeting these long-term GHG goals, although the specific path to compliance is unknown (CARB 2014).

[5] The Final Statement of Reasons for the amendments to the CEQA Guidelines reiterates the statement in the Initial Statement of Reasons that "[t]he Scoping Plan may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (CNRA 2009).

EO B-55-18 (September 2018) establishes a statewide policy for California to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net-negative emissions thereafter.

CARB has expressed optimism regarding both the 2030 and 2050 goals. It states in the First Update to the Climate Change Scoping Plan that "California is on track to meet the near-term 2020 GHG emissions limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). With regard to the 2050 target for reducing GHG emissions to 80% below 1990 levels, the First Update to the Climate Change Scoping Plan states that the level of reduction is achievable in California (CARB 2014). CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, SB 32, and EO S-3-05. This is confirmed in the Second Update, which states (CARB 2017, p. 7):

> The Proposed Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while also identifying new, technologically feasibility [sic] and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Proposed Plan is developed to be consistent with requirements set forth in AB 32, SB 32, and AB 197.

The proposed project would not interfere with implementation of any of the above-described GHG reduction goals for 2030 or 2050 because the project would not exceed the SCAQMD's recommended threshold of 10,000 MT CO_2e per year (SCAQMD 2008). Because the proposed development project would not exceed the threshold, this analysis provides support for the conclusion that the project would not impede the state's trajectory toward the above-described statewide GHG reduction goals for 2030 or 2050.

The proposed project's consistency with the state's Scoping Plan would assist in meeting each jurisdiction's contribution to GHG emission reduction targets in California. With respect to future GHG targets under SB 32 and EO S-3-05, CARB has also made clear its legal interpretation that it has the requisite authority to adopt whatever regulations are necessary, beyond the AB 32 horizon year of 2020, to meet the SB 32 40% reduction target by 2030 and the EO S-3-05 80% reduction target by 2050. This legal interpretation by an expert agency provides evidence that future regulations will be adopted to continue the trajectory toward meeting these future GHG targets.

Based on the above considerations, the proposed development project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. Impacts would be less than significant.

3.9 Hazards and Hazardous Materials

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS – Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☐	☒

TPM 38215 is a Finance Map only, with no reasonably foreseeable development on the northern parcels. There would be no physical environmental changes on the northern parcels; therefore, there would be no impacts relative to hazards and hazardous materials on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate analysis and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the Phase I Environmental Site Assessment included as Appendix F to this IS/MND.

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction Activities

Less Than Significant Impact. During construction of the proposed development project, potentially hazardous materials would likely be handled on the project site. These materials would include gasoline, diesel fuel, lubricants, and other petroleum-based products used to operate and maintain construction equipment. Handling these potentially hazardous materials would be temporary and would coincide with the short-term construction phase of the proposed development project.

In addition, if removal of any construction-generated hazardous waste from the project site is required, the development applicant must use a certified hazardous waste transportation company to haul hazardous waste to a permitted facility for treatment, storage, recycling, or disposal. Based on the above provisions, the proposed development project would not create a significant hazard to the public or environment and impacts would be less than significant.

Operation Activities

Less Than Significant Impact. During the operation phase of the development project, gasoline and diesel fuel—which are considered hazardous materials—would be routinely handled, stored, and dispensed on the development project site. Five underground storage tanks (USTs) are proposed on-site: a 20,000-gallon unleaded gasoline tank, a 12,000-gallon unleaded premium gasoline tank, a 10,000-gallon diesel fuel tank, a 4,000-gallon diesel exhaust fluid tank, and a 30,000-gallon bio-diesel tank. Fuel tankers would utilize I-10 to Sandalwood Drive to 7th Street to access the project site. Truck drivers would be subject to federal and state requirements that regulate the transport of hazardous materials and the operation of fuel tanker trucks. On the project site, tanker trucks would transfer fuel to the USTs, which would be permitted by the County of Riverside Department of Environmental Health Hazardous Materials Management Branch. Permitting requires submittal of UST plans to the Hazardous Materials Management Branch prior to installation, modification, repair, or removal of a UST. In addition, the development applicant would be required to prepare and implement a Hazardous Materials Business Plan (HMBP), pursuant to the Riverside County Municipal Code Chapter 8.64, which would be reviewed and approved by the Riverside County Department of Environmental Health. The purpose of the HMBP is to assist business owners with compliance with state requirements and provide emergency responders with adequate information about the type and quantity of hazardous materials stored at a facility. Although inadequate maintenance of USTs may result in leaks, California Code of Regulations Title 23, Chapter 16 and Riverside County Ordinance 617 mandate regular monitoring, maintenance, and inspection of USTs, which would ensure the safe and appropriate operation of the proposed UST on site (County of Riverside 2020).

Travel Center patrons would regularly use hazardous materials while dispensing fuel at the pumps. Refueling activities release benzene into the air; however, benzene emissions can be reduced by more than 90% by the vapor recovery systems required at fuel pumps. Nevertheless, benzene emissions have the potential to cause near-source health risks (CARB 2005). CARB recommends siting sensitive land uses, such as residences, at least 50 feet (15.2 meters) from typical gasoline dispensing facilities (CARB 2005). The proposed fueling canopies would be set back approximately 100 feet from the northern and western property boundaries. The closest residence is located approximately 0.2 miles north of the development

project site. Therefore, the proposed fuel pumps would be located outside the recommended 50-foot buffer and benzene emissions would not pose a risk to the nearest residences.

Routine inspection of the travel center, the permitted USTs, all associated fuel delivery infrastructure, and compliance with all federal, state, and local regulations would ensure that operation of the proposed development project would not pose significant hazards to the public or environmental. Impacts would be less than significant.

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction Activities

Less Than Significant Impact. Construction at the development project site would involve the temporary use of small quantities of hazardous and/or flammable materials, including diesel fuel, gasoline, and other oils and lubricants. The use, storage, transport, and disposal of these materials would comply with all existing local, state, and federal regulations, as previously described. Nonetheless, accidental/incidental spills of construction-related contaminants (e.g., fuels and oils) could occur during grading and construction, thereby degrading water quality in the project vicinity. Because the proposed project would exceed 1 acre in size, the development applicant would be required to comply with the General Construction Activity NPDES Permit (Order No. 2009-0009-DWQ, as amended by Order No. 2010-0014-DWQ, NPDES No. CAS000002), which requires the development applicant to prepare and implement a SWPPP during construction activities. The SWPPP must include water quality protection measures with respect to incidental spills of petroleum products and hazardous materials, including secondary containment of fluid containers, storing fluid containers indoors during rain events, placing drip pans under equipment when not in use, and designating specific areas for equipment fueling and maintenance with surrounding spill containment booms. With implementation of erosion and spill control measures stipulated in a project-specific SWPPP, the proposed development project would not create a significant hazard to the public or environmental through accidental release of hazardous materials during construction activities. Impacts would be less than significant.

Operation Activities

Less Than Significant Impact. During the operation phase of the proposed development project, spills and other accidental release of gasoline could contaminate soils or surface water in the project vicinity. The Riverside County Department of Environmental Health Hazardous Materials Management Branch, as the State Certified Unified Program Agency in the City, is responsible for review and approval of the project-specific HMBP. The HMBP that would set forth operational procedures, emergency contact information, emergency response plan for containment spills or release of vapors and other information required in the HMBP (County of Riverside 2020; refer to Section 3.9[a]). Implementation of the HMBP would ensure that an emergency response plan is in place in the event that hazardous materials were accidentally released during operations. Impacts would be less than significant.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No Impact. The nearest school to the project site is Mesa View Middle School, located approximately 0.5 miles to the northwest at 800 Mustang Way, Calimesa. As discussed in the response in Section 3.7(a), construction and operation of the proposed project would comply with all applicable federal, state, and local regulations. In addition, fuel tankers would access the project site via I-10 to Sandalwood to 7th Street, which would not require the trucks to be in close proximity to any nearby schools. No impact would occur.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less Than Significant Impact. Pursuant to Government Code 65962.5 and its subsections, record searches on the development project property were performed within the following databases: GeoTracker, EnviroStor, and the U.S. Environmental Protection Agency (EPA) Enforcement and Compliance History Online.

The GeoTracker database did not identify Leaking Underground Storage Tank Cleanup Sites, Land Disposal Sites, Military Sites, Department of Toxic Substances Control Hazardous Waste Permits, Department of Toxic Substances Control Cleanup Sites, or Permitted Underground Storage Tanks within or adjacent to the development site. The nearest registered GeoTracker database site is located approximately 0.1 miles east of the development site. The County Cork Liquor, at 1198 Calimesa Boulevard, was listed as a Leaking Underground Storage Tank Cleanup Site. However, the status of the site is "completed -- case closed" as of July 2003 (SWRCB 2021). Therefore, this site does not pose a threat to the development site due to its distance and case closed status.

The EnviroStor database did not register a federal Superfund, a State Response, Voluntary Cleanup, School Cleanup, Evaluation, School Investigation, Military Evaluation, Tiered Permit, or Corrective Action Site in close proximity to the development site. The nearest cleanup site is a School Investigation at Mesa View Middle School, located approximately 0.5 miles northwest of the development site. No contaminants were identified, and the status is listed as "no action required" as of May 2002 (DTSC 2021).

No indication of the project development site was found when consulting the Enforcement and Compliance History Online database (EPA 2021).

In addition to the database searches summarized above, a Phase I Environmental Site Assessment was completed for the development site (Appendix F). The Phase I Environmental Site Assessment found no evidence of a recognized environmental condition (e.g., the presence or likely presence of any hazardous substances or petroleum projects in, on, or at a property) within the development site. Although the development site was historically used for agricultural purposes, it is likely that any pesticides, herbicides, and fertilizers which may have been used and/or stored on site have since degraded. Therefore, the possible former use of agricultural chemicals is not expected to represent a significant environmental concern. The Phase I Environmental Site Assessment concluded that further investigation is not warranted for the proposed development project. However, if the development project were to include residential development, then soil sampling for agricultural use would be warranted (Appendix F).

In conclusion, impacts related to being located on a site listed on a hazardous materials database would be less than significant.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact. The project site is not within an adopted airport land use compatibility plan or within 2 miles of a public airport. The nearest airport to the project site is Redlands Municipal Airport, located approximately 7.5 miles to the northwest at 1755 Sessums Drive, Redlands. Because the project site is not within an airport land use compatibility plan, it would not result in safety hazards for people residing or working in the project area. As such, no impact would occur.

f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

No Impact. The proposed development project includes development of gasoline and diesel fueling pumps, a convenience store, and a common area for customers on a parcel that is slated for commercial development under the City's General Plan. No existing or proposed roadways would be impacted by the proposed development project that would affect the evacuation routes established by the City (City of Calimesa 2014d). In addition, the proposed development project would be required to implement any applicable programs for the Riverside County Disaster Preparedness Plan in the event of a natural disaster or other emergency. As such, the proposed development project would not impair implementation of or interfere with an adopted emergency response plan, and no impact would occur.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?

No Impact. The development project site is served by the City of Calimesa Fire Department (refer to Section 3.15, Public Services). There are no state responsibility areas within the City of Calimesa, based on City of Calimesa Fire Hazard Severity Zone map (CAL FIRE 2009). The nearest state responsibility area is located approximately 1.5 miles west of the project site within unincorporated Riverside County. In addition, there are no Very High Fire Severity Zones near the project site, within the City of Calimesa Local Responsibility Area (CAL FIRE 2009). The nearest Local Responsibility Area (LRA) to the development project site is located approximately 1 mile southwest of the project site. In addition, compliance with local and state regulations would ensure proper installation and maintenance of USTs storing diesel fuel on site and proper handling and cleanup of hazardous materials within the project site. As such, compliance with applicable local and state regulations, flammable hazardous materials within the project site would be managed to avoid accidental spills that could result in fires. Therefore, the proposed development project would not expose people or structures to a significant risk associated with wildland fires and no impact would occur.

3.10 Hydrology and Water Quality

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
X. HYDROLOGY AND WATER QUALITY – Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i) result in substantial erosion or siltation on or off site;	☐	☐	☒	☐
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;	☐	☐	☒	☐
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv) impede or redirect flood flows?	☐	☐	☒	☐
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to hydrology or water quality on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate hydrology and water quality analysis and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the Geotechnical Engineering Investigation (Appendix D), Hydrology Report (Appendices G1–G3), and Water Quality Management Plan (WQMP) (Appendix H).

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less Than Significant Impact. Construction and operation of the Sandalwood Travel Center would generate pollutants that may impact stormwater quality. The Santa Ana RWQCB sets water quality standards for all

ground and surface waters within the project's region. Water quality standards are defined under the CWA to include both the beneficial uses of specific water bodies and the levels of water quality that must be met and maintained to protect those uses (water quality objectives).

Short-Term Construction

Construction-related activities have the potential to result in impacts to water quality due to grading activities that would potentially cause erosion and sedimentation in runoff. Sediments also transport substances such as nutrients, hydrocarbons, and trace metals, which could be conveyed to the storm drain facilities and receiving waters, including San Timoteo Creek and the Santa Ana River. Substances such as fuels, oil and grease, solvents, paints and other building construction materials, wash water, and dust control water could also enter storm runoff and be transported to nearby waterways. This could potentially degrade the quality of the receiving waters and lead to the impairment of downstream water sources.

Construction activities associated with the proposed development project would disturb approximately 4.2 acres of soil. Projects that disturb greater than 1 acre of soil are required to comply with the State Water Resources Control Board's NPDES permit Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction and Land Disturbance Activities (Order No. 2009-0009-DWQ, NPDES No. CAS000002, as amended by Orders No. 2010-0014-DWQ and 2012-0006-DWQ) (Construction General Permit). In compliance with the Construction General Permit, a SWPPP would be prepared for the development project and construction BMPs implemented to target pollutants of concern. Compliance with the Construction General Permit would ensure that the development project's construction-related impacts to water quality would be less than significant.

Long-Term Operation

The project site is currently undeveloped. Development of the proposed project would result in construction of impervious surfaces across most of the project site, which would reduce ground percolation and increase stormwater runoff. Potential pollutants of concern that could be generated by long-term operation of the proposed project include metals, solvents, trash and debris, and oil and grease. These pollutants may lead to the degradation of stormwater quality in downstream water bodies, including San Timoteo Creek and the Santa Ana River.

The Municipal Storm Water Permitting Program regulates stormwater discharges from municipal separate storm sewer (drain) systems (MS4s). The Santa Ana MS4 permit was issued in 2010 and amended in 2013 (Santa Ana RWQCB 2013). The Santa Ana MS4 Permit covers the portion of the Santa Ana River watershed located within Riverside County (Order No. R8-2010-0033, NPDES Permit No. CAS618033). To date, the Riverside County Flood Control and Water Conservation District (principal permittee), the County of Riverside, and the City of Calimesa, along with 14 other incorporated cities therein (co-permittees), discharge pollutants from their MS4s (Santa Ana RWQCB 2013). Urban runoff from the stormwater and non-stormwater flows are conveyed through the MS4s and discharged to surface water bodies within the Santa Ana River watershed.

The MS4 permit requires the development and implementation of a program addressing stormwater pollution issues in development planning for private projects. Pursuant to the Santa Ana MS4 permit, a WQMP, which includes project-specific post-construction BMPs to address potential runoff and ongoing maintenance of on-site drainage improvements, has been prepared for the project (Appendix H). The WQMP includes three

bioretention basins to be constructed along the western property boundary, which would filter residual stormwater pollutants prior to stormwater being discharged to the storm drain. In addition, landscaping would be installed around the perimeter of the site, as well as within select interior areas, which would serve as self-treating areas to further reduce stormwater pollution. Implementation of the project-specific WQMP would ensure compliance with established water quality standards. Therefore, through compliance with the Santa Ana MS4 permit and implementation of a project-specific WQMP, the proposed project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality. As such, impacts would be less than significant.

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Groundwater Supplies

Less Than Significant Impact. The City of Calimesa is primarily served by groundwater from the San Timoteo Subbasin of the Beaumont Groundwater Basin. Wells for domestic use in the City are operated by the South Mesa Water Company, the Yucaipa Valley Water District, and the Beaumont Cherry Valley Water District. In addition, the San Gorgonio Pass Water Agency provides State Water Project to the City (City of Calimesa 2014d). The subbasin is bounded to the north and northeast by the Banning fault and impermeable rocks of the San Bernardino Mountains, Crafton Hills, and Yucaipa Hills; on the south by the San Jacinto Fault; on the west by the San Jacinto Mountains; and on the east by a topographic drainage divide with the Colorado River Hydrologic Region. The surface of the subbasin is drained by Little San Gorgonio Creek and San Timoteo Canyon, which flow to the Santa Ana River. Groundwater in the San Timoteo Subbasin is replenished by subsurface inflow and percolation of precipitation, runoff, wastewater discharge, and imported water. Runoff and imported water are delivered to streambeds and spreading grounds for percolation. The San Timoteo Subbasin is not adjudicated, and reliable estimates of total groundwater extractions are not available. However, water table elevations within the San Timoteo Subbasin have not declined over the years, which is likely due to the constant flow of treated wastewater from the Yucaipa Valley Water District that flows through San Timoteo Creek (SBVMWD 2016).

The San Timoteo Subbasin is classified as a low to very low priority with respect to groundwater basin prioritization under the Sustainable Groundwater Management Act. Basins with a medium to high priority ranking are required to complete a Groundwater Sustainability Plan and manage groundwater for long-term sustainability. Currently, the non-adjudicated portion of the San Timoteo Subbasin is managed by the San Timoteo Groundwater Sustainability Agency (GSA), which is formed via a Memorandum of Agreement between four Forming Parties, including the City of Redlands, San Gorgonio Pass Water Agency, Beaumont Cherry Valley Water District, and Yucaipa Valley Water District. Each agency overlies a portion of the subbasin and exercises water management, water supply, or land use authority within a portion of the subbasin. The San Timoteo GSA coordinates with the Eastern Municipal Water District, which manages a separate GSA in the southern non-adjudicated portion of the basin (California DWR 2021a, 2021b). Because the San Timoteo Subbasin is classified as a low to very low priority with respect to groundwater basin prioritization and because water table elevations within the San Timoteo Subbasin have not declined over the years, the project would not substantially decrease groundwater supplies such that the project may impede sustainable groundwater management of the basin. Impacts would be less than significant.

Groundwater Recharge

Less Than Significant Impact. The proposed Sandalwood Travel Center development project would include construction of impervious surfaces across the majority of the project site, which is currently undeveloped. Therefore, an increase in impervious surfaces would decrease percolation potential within the project site. As noted in the Geotechnical Investigation (Appendix D) conducted for the proposed project, groundwater was not encountered in exploratory borings at depths up to 34.5 feet below ground surface. In addition, based on the soil borings, on-site soils consist primarily of dense silt and clay, which is not conducive to percolation of stormwater. Percolation tests confirmed that infiltration rates are extremely slow. In addition, although implementation of the proposed development project would reduce the pervious areas available for potential natural recharge, the area of the project site is relatively small (approximately 4.2 acres) in relation to the areal size of the groundwater basin (188,000 acres), providing little opportunity to recharge under existing conditions. As a result, implementation of the proposed project would not significantly interfere with groundwater recharge and impacts would be less than significant.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in substantial erosion or siltation on or off site?

Less Than Significant Impact. Stormwater runoff currently occurs as sheet flow towards the western property boundary. Project grading would alter existing ground contours of the project site and new construction would increase the impervious surface area on the site, all of which would result in changes to the existing drainage patterns. By increasing the amount of impervious surfaces on the site, more surface runoff would be generated, and the rate and volume of runoff would increase. Unabated increased runoff rates could potentially result in off-site erosive scour and sedimentation of downstream drainages, Timoteo Creek, and the Santa Ana River.

However, runoff generated from the proposed project would be directed towards the west where flows would be captured and treated through three proposed bio-retention basins and an underground detention basin. The latter would consist of a 22-foot-long, 60-inch-diameter corrugated metal pipe with a capacity of 21,598 cubic feet. The combined capacity of the bioretention basins would be 9,866 cubic feet and the capacity of the underground detention basin would be 21,598 cubic feet, for a total combined capacity of 31,464 cubic feet. The maximum stormwater runoff volume associated with the 2-year, 10-year, and 100-year storm event would be 31,114 cubic feet (Appendix G-1). Therefore, the proposed detention devices would reduce off-site runoff volumes to less than existing conditions.

Post-construction runoff rates are the primary driver of potential off-site erosive scour. Based on the Riverside County Flood Control and Water Conservation District Hydrology Manual (RCFCWCD 1978), in cases where excess volume from the project site cannot be infiltrated or captured and reused on site, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow. The initial Hydrology Report for the proposed project (Appendix G-1) did not calculate post-construction runoff rates associated with the 2-year peak flow event, including incorporation of the proposed detention devices. An addendum letter to the Hydrology Report (Appendix G-2) calculated pre- and post-development runoff rates, but without detention.

However, an additional addendum (Appendix G-3) demonstrates that post-detention runoff rates would remain less than or equal to pre-development runoff rates. As a result, implementation of the proposed project would not substantially alter the drainage pattern of the site, including the addition of impervious surfaces, in a manner that would result in substantial erosion or siltation on or off site. Impacts would be less than significant.

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

Less Than Significant Impact. As discussed in Section 3.10(c)(i), unabated increased runoff rates could potentially result in off-site flooding of downstream drainages. However, runoff generated from the proposed project would be directed towards the west where flows would be captured and treated through three proposed bio-retention basins and an underground detention basin. The combined capacity of the bioretention basins and the underground detention basin would reduce off-site runoff volumes to less than existing conditions. Discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow. The initial Hydrology Report for the proposed project (Appendix G-1) did not calculate post-construction runoff rates associated with the 2-year peak flow event, including incorporation of the proposed detention devices. An addendum letter to the Hydrology Report (Appendix G-2) calculated pre- and post-development runoff rates, but without detention. However, an additional addendum (Appendix G-3) demonstrates that post-detention runoff rates would remain less than or equal to pre-development runoff rates. As a result, implementation of the proposed project would not substantially alter the drainage pattern of the site, including the addition of impervious surfaces, in a manner that would substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site. Impacts would be less than significant.

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Less Than Significant Impact. As discussed in Sections 3.10(c)(i) and 3.10(c)(ii), unabated increased runoff rates could potentially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems. However, runoff generated from the proposed project would be directed toward the west, where flows would be captured and treated through three proposed bio-retention basins and an underground detention basin. The combined capacity of the bioretention basins and the underground detention basin would reduce off-site runoff volumes to less than existing conditions. However, the initial Hydrology Report for the proposed project (Appendix G-1) did not calculate post-construction runoff rates associated with the 2-year peak flow event, including incorporation of the proposed detention devices. An addendum letter to the Hydrology Report (Appendix G-2) calculated pre- and post-development runoff rates, but without detention. However, an additional addendum (Appendix G-3) demonstrates that post-detention runoff rates would remain less than or equal to pre-development runoff rates. As a result, implementation of the proposed project would not substantially alter the drainage pattern of the site, including the addition of impervious surfaces, in a manner that would create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems.

As previously discussed in Section 3-10(a), a WQMP, which includes project-specific post-construction BMPs to address potential runoff and ongoing maintenance of on-site drainage improvements following construction and site paving, has been prepared for the project (Appendix H). Implementation of the WQMP would ensure compliance with established water quality standards during project operations. Therefore, through compliance with the Santa Ana MS4 permit and implementation of the project-specific WQMP, the proposed project would not provide substantial additional sources of polluted runoff as a result of paving and project operations. As such, impacts would be less than significant.

iv) impede or redirect flood flows?

Less Than Significant Impact. The project site is located within Zone X of the Federal Emergency Management Agency Flood Insurance Rate Map panel 06065C0785G, dated August 28, 2008 (FEMA 2008). Zone X represents areas of minimal flood hazard. Construction of the proposed project would not impede or redirect flood flows within a designated 100-year flood plain. Stormwater captured on-site would be treated, and directed to adjacent roadways, similar to existing conditions. Therefore, impacts would be less than significant.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

No Impact. As discussed in Section 3.10(c)(iv), the proposed project is not within a 100-year flood zone (FEMA 2008). The project site is not located near the Pacific Ocean nor adjacent to a reservoir or body of water; therefore, there is no risk of tsunamis or seiches. In addition, the project site is not located within a potential dam inundation area (County of Riverside 2019). As such, there is no risk of release of pollutants due to project inundation and no impacts would occur.

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

No Impact. The project site is under the jurisdiction of the Santa Ana RWQCB, which has established water quality objectives and beneficial uses in the Santa Ana River Water Quality Control Plan (Basin Plan) for Timoteo Creek and the Santa Ana River, located downstream of the project site. These water quality objectives are intended for the reasonable protection of the present and probable beneficial uses of California inland water bodies including bays, estuaries, and groundwater. The City implements measures with the RWQCB and ensures compliance with the Basin Plan through requirements to obtain applicable NPDES permits. These requirements are outlined in Chapter 16.10 of the City's Municipal Code. As such, the proposed development project would not conflict with the Basin Plan and no impacts would occur.

In addition, as discussed in Section 3.10(b), the City of Calimesa is primarily served by groundwater from the San Timoteo Subbasin of the Beaumont Groundwater Basin. The San Timoteo Subbasin is classified as a low to very low priority with respect to groundwater basin prioritization under the Sustainable Groundwater Management Act. Currently, the non-adjudicated portion of the San Timoteo Subbasin is managed by the San Timoteo GSA, which coordinates with the Eastern Municipal Water District in managing a separate GSA in the southern non-adjudicated portion of the basin (California DWR 2021a, 2021b). Because the San Timoteo Subbasin is classified as a low to very low priority with respect to groundwater basin prioritization and because groundwater withdrawals would be completed in accordance with the GSAs, the project would not conflict with or obstruct implementation of a groundwater sustainability plan and no impacts would occur.

3.11 Land Use and Planning

		Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XI.	**LAND USE AND PLANNING** – Would the project:				
a)	Physically divide an established community?	☐	☐	☐	☒
b)	Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

TPM 38215 would not result in any physical environmental changes or changes in zone or land use designation on the northern parcels. Therefore, there would be no impacts relative to land use or planning impacts on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate land use and planning analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) Would the project physically divide an established community?

No Impact. The proposed project site is designated for commercial development. Development of the project site with gasoline and diesel fueling positions, a convenience store, and a common area for customers would not physically disrupt or divide the arrangement of an established community. Existing roadways are adjacent to the west easy of the project site. The nearest residence is approximately 0.2 miles to the north. An existing commercial development is adjacent to the southern project site boundary. Connectivity between the project site and surrounding areas would be maintained, and no division of an established community would occur. Overall, no impact would occur.

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant Impact. The proposed project is consistent with land use plans, policies, and regulations.

Regional Plans

SCAG is the Metropolitan Planning Organization for six counties: Riverside, Los Angeles, Orange, San Bernardino, Ventura, and Imperial. The proposed project would not be considered regionally significant by SCAG based on the established criteria in Section 15206 of the CEQA Guidelines, which is applied by SCAG to determine regional significance. Therefore, SCAG's regional plans and programs, including the 2016–2040 RTP/SCS are not applicable to the proposed project.

The project's consistency with regional plans and programs that address specific topical issues are discussed in the respective sections of this IS/MND. This includes but is not limited to the SCAQMD AQMP (refer to Section 3.3, Air Quality), Western Riverside MSHCP (refer to Section 3.4, Biological Resources), and the Santa Ana River Water Quality Control Plan (refer to Section 3.10, Hydrology and Water Quality). As

indicated in the analysis presented in this IS/MND, the proposed project would be consistent with the requirements outlined in these regional plans, including requirements in place to avoid or mitigate environmental effects.

City of Calimesa

The City of Calimesa General Plan and Zoning Ordinance define the permitted land uses and the corresponding development standards within the City. The project site is designated Community Commercial (C-C) in the General Plan Land Use Map (City of Calimesa 2014a) and the City's Zoning Districts (City of Calimesa 2014b). The General Plan land use and zoning designation for the project site and surrounding properties is shown on Figure 3. The proposed project will comply with all Zoning Code development and design standards for Commercial Zone Districts, outlined in Chapter 18.25 of the City's Municipal Code. A variance will be required for the installation of two (of the three) illuminated monument signs and to allow an 80-foot-tall freeway pylon with digital fuel pricing.

The Sandalwood Travel Center fuel dispensers and proposed sale of alcohol are conditionally permitted within the C-C zoning designation. A CUP is required for uses that are necessary and appropriate in the district but require specific consideration of the proposed use due to the use's unique character, including but not limited to, the possible effect of the use on public facilities or surrounding uses. In compliance with the City's Zoning Code, the applicant has applied to the City for CUPs for operation of fuel dispensers and the proposed sale of alcohol and the City will conduct discretionary review of the CUPs. The City would approve the CUP if they determine that the proposed land uses would not have an adverse effect on the surrounding area. The potential environmental impacts resulting from implementation of the proposed project, including impacts to surrounding uses, have been addressed throughout this Initial Study.

In summary, as presented in the analysis above and in the respective sections of this IS/MND, the proposed development project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

3.12 Mineral Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XII. MINERAL RESOURCES – Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts to mineral resources on the northern parcels. Therefore, the following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. The California Geological Survey has established a classification system to denote both the location (i.e., zone) and significance of key extractive mineral resources through classification of Mineral Resource Zones (MRZs). The proposed development project is mapped as MRZ-3, indicating that it is located in an area that contains mineral deposits, but the significance of these cannot be determined from available data. Although it is mapped as MRZ-3, there are no known mineral resource deposit sites within or near the project site (DOC 2015).

Construction of the proposed development project would require use of common construction materials, such as asphalt, concrete, and gravel. These materials are widely available throughout the region; therefore, the proposed project would not result in the loss of regionally or locally designated "significant" deposits of mineral resources required for project construction (i.e., deposits classified by the California Geological Survey as MRZ-2 or deposits listed as locally important on a general plan).

In addition, the project site is not located within an area known to be underlain by regionally or locally important mineral resources or within an area that has the potential to be underlain by regionally or locally important mineral resources (DOC 2015). Therefore, the proposed development project would not result in loss of a known mineral resource and no impact would occur.

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

No Impact. The project site is not located within an area known to be underlain by regionally or locally important mineral resources (DOC 2015). In addition, the proposed project would be developed on a 4.0-acre site with adjacent roadways on the western and eastern site boundaries and an existing commercial development directly to the south. As such, the existing land uses would preclude the use of the project site for future mining activities. Therefore, implementation of the proposed project would not result in the loss of availability of a locally important mineral resource recovery site and no impact would occur.

3.13 Noise

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIII. NOISE – Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☒	☐	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to noise on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate noise analysis and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the noise modeling results, Appendix I, and the Traffic Impact Assessment (TIA), Appendix J-1, to this IS/MND.

3.13.1 Noise Characteristics and Terminology

Pressure fluctuations, traveling as waves through air from a source, exert a force perceived by the human ear as sound. Sound pressure level (referred to as sound level) is expressed by way of a logarithmic scale in decibels (dB) that represent magnitude of these air pressure waves with respect to the threshold of average human hearing. The human ear is more sensitive to middle and high frequencies, especially when the noise levels are quieter; thus, to accommodate for this phenomenon, a weighting system was developed to mimic this human hearing frequency response. The frequency weighting called the “A” scale is typically used for typical environmental sound levels, which de-emphasizes the low frequency components of the sound in a manner similar to the response of a human ear. This A-weighted sound level is also often referred to as the “noise level” and is referenced in units of dBA. In a manner similar to the scaling of temperature on a thermometer, Table 17 provides examples of common indoor and outdoor sound sources having A-weighted levels that “line-up” with the listed dB values.

The equivalent noise level L_{eq}, also referred to as the energy-average sound level, is a single number representing the fluctuating sound level in decibels (dB) over a specified period of time. It is a sound-energy average of the fluctuating level and is equal to a constant unchanging sound of that dB level. Community noise sources vary continuously, being the product of many noise sources at various distances, all of which in aggregate tend to constitute a relatively stable background sound environment. This background, added to perceptibly dominant

acoustical contributors (i.e., those that are the loudest and/or closest to the listener position) makes the "ambient" sound that a sound level meter can detect with its microphone and quantify as a dB level.

Table 17. Typical Sound Levels in the Environment and Industry

Common Outdoor Activities	Noise Level (dB)	Common Indoor Activities
—	110	Rock band
Jet flyover at 300 meters (1,000 feet)	100	—
Gas lawn mower at 1 meter (3 feet)	90	—
Diesel truck at 15 meters (50 feet), at 80 kph (50 mph)	80	Food blender at 1 meter (3 feet) Garbage disposal at 1 meter (3 feet)
Noisy urban area, daytime gas lawn mower at 30 meters (100 feet)	70	Vacuum cleaner at 3 meters (10 feet)
Commercial area Heavy traffic at 90 meters (300 feet)	60	Normal speech at 1 meter (3 feet)
Quiet urban daytime	50	Large business office Dishwasher, next room
Quiet urban nighttime	40	Theater, large conference room (background)
Quiet suburban nighttime	30	Library
Quiet rural night time	20	Bedroom at night, concert hall (background)
—	10	Broadcast/recording studio
Lowest threshold of human hearing	0	Lowest threshold of human hearing

Source: Caltrans 2013.
Notes: dB = decibels; kph = kilometers per hour; mph = miles per hour.

Exterior Noise Distance Attenuation

Stationary operating equipment or slow-moving (or idling) vehicles within a spatially limited area at a given time can be considered "point sources" emitting noise that typically diminishes (attenuates) at a rate of 6.0 dBA for each doubling of distance from the source to the receptor at acoustically "hard" sites and at a rate of 7.5 dBA for each doubling of distance from source to receptor at acoustically "soft" sites. These attenuation rates would also be expected for sound propagation away from a horizontal area source, which can be approximated as a single point such as the geographic center of the area. Acoustically hard or otherwise acoustically reflective surfaces do not provide any excess ground-effect attenuation and are characteristic of sealed asphalt roads, bodies of water, and hard-packed soils. This means the attenuation experienced for hard-surface conditions is attributed only to "geometric divergence" that yields the aforementioned 6.0 dB per doubling of distance from a point source. An acoustically soft or absorptive surface, on the other hand, is exemplified by fresh-fallen snow, soft sand, tilled soils, or thickly vegetated ground cover and accounts for the higher attenuation rate (7.5 dB per doubling) with increasing distance from the source of sound emission.

Sound propagation between a source and a receptor position can further be attenuated by the presence of path-intervening man-made or natural barriers. The amount of attenuation varies with the degree of sound path occlusion and the proximity of the barrier to the source or the receptor. The air medium that conveys sound is acoustically absorptive as well, but the added sound attenuation effect—apart from geometric divergence already introduced—

is greatly dependent on acoustical frequency and typically requires large distances between a source and the receptor to be meaningful.

3.13.2 Applicable Noise Regulations

Noise standards for the City of Calimesa are established primarily by the Noise Element of the City of Calimesa General Plan. The Noise Element includes standards for land use compatibility for community noise exposure. Residential uses are normally unacceptable in areas exceeding 70 dBA community noise equivalent level (CNEL) and conditionally acceptable between 60 to 70 dBA CNEL for single family and 65 to 70 dBA CNEL for multi-family units. Commercial/office buildings are normally unacceptable in areas exceeding 75 dBA CNEL and conditionally acceptable within 67 to 78 dBA CNEL.

Transportation Related Noise Standard

In community noise assessment, changes in noise levels greater than 3 dBA are often identified as "barely perceptible," while changes of 5 dBA are "readily perceptible" (Caltrans 2013). For purposes of this study, roadway noise impacts would be considered significant if the project increases noise levels for a noise-sensitive land use by 3 dBA CNEL and if (1) the existing noise levels already exceed the 65 dBA CNEL residential standard or (2) the project increases noise levels from below the 65 dBA CNEL standard to above 65 dBA CNEL.

Exterior Non-Transportation Related Noise Standard

The City of Calimesa noise ordinance limits the noise levels from non-transportation sources at residential uses to 55 dBA from the hours of 10:00 p.m. to 7:00 a.m. and to 65 dBA from the hours of 7:00 a.m. to 10:00 p.m.

Standard for Temporary Noise Sources (Construction-Related Noise)

According to Section 8.15.080 of the Calimesa Municipal Code, construction activities are prohibited between 7:00 p.m. and 7:00 a.m. on weekdays, and between 5:00 p.m. and 10:00 a.m. on weekends and federal holidays. In addition, the 8-hour average noise level during permissible construction hours is limited to 75 dBA L_{eq} when such noise could affect a residential land use. In terms of construction noise levels as compared to ambient levels, given that a 10 dB increase is perceived as a doubling of the sound level, construction noise that would exceed ambient noise levels by at least 10 dB would be readily identified separate from ambient levels, and could therefore result in annoyance at noise-sensitive receivers. Particularly at night, noise levels greater than 10 dB over ambient conditions could easily result in sleep disturbance at residences.

Existing Ambient Noise Levels

Dudek employed the Federal Highway Administration (FHWA) Traffic Noise Model using average daily traffic data provided in the TIA (Appendix J-1) to determine ambient noise levels at selected noise-sensitive receiver locations. The receptors are close enough to the roadways in each case that roadway traffic represents the dominant noise source at the receivers. Table 18 provides the modeled ambient noise levels at noise-sensitive receptors that could be impacted by noise from construction or operation of the project.

Table 18. Existing Ambient Noise Levels at Selected Receivers (dBA)

Receiver	Daytime L_{eq}	Nighttime L_{eq}	CNEL	Distance from Project Site (feet)
Calimesa Inn	57	48	57	835
Sandalwood East of Calimesa	62	53	62	1,075
Calimesa South of Sandalwood	64	56	65	2,970
Villa Calimesa /7th	55	46	57	975

Notes: "Selected receiver" is synonymous with "sensitive receptor."
dBA = A-weighted sound pressure level; L_{eq} = equivalent continuous sound level; CNEL = community noise equivalent level.

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Noise (Temporary)

Less Than Significant Impact with Mitigation Incorporated. The construction activities for the proposed Sandalwood Travel Center development project would include site preparation, grading and trenching of the site, building construction, paving of the on-site driveways and parking areas, and application of architectural coatings. Noise impacts from construction activities are a function of the noise generated by construction equipment, equipment location, and sensitivity of nearby land uses, and the timing and duration of the construction activities. The nearest noise-sensitive land use to the project site is the Calimesa Inn, located approximately 835 feet east (across I-10). The closest residences are located approximately 975 feet to the north and approximately 1,075 feet east of the development project.

Construction noise is difficult to quantify because of the many variables involved, including the specific equipment types, size of equipment used, percentage of time, condition of each piece of equipment, and number of pieces of equipment that will actually operate on site. The range of maximum noise levels for various types of construction equipment at a distance of 50 feet is depicted in Table 19. The noise values represent maximum noise generation, or full-power operation of the equipment. As an example, a loader and two dozers, all operating at full power and relatively close together, would generate a maximum sound level of approximately 90 dBA at 50 feet from their operations. As one increases the distance between equipment, and/or the separation of areas with simultaneous construction activity, dispersion and distance attenuation reduce the effects of separate noise sources added together. In addition, typical operating cycles may involve 2 minutes of full-power operation, followed by 3 or 4 minutes at lower levels. The average noise level during construction activity is generally lower, because maximum noise generation may only occur up to 50% of the time. Noise levels from construction operations decrease at a rate of approximately 6 dB per doubling of distance from the source.

Table 19. Construction Equipment Noise Emission Levels

Equipment	Typical Sound Level (dBA) 50 Feet from Source
Roller	74
Concrete vibrator	76
Pump	76
Saw	76
Backhoe	80

Table 19. Construction Equipment Noise Emission Levels

Jackhammer	88
Truck	88
Paver	89

Source: FHWA 2008.
Note: dBA = A-weighted sound pressure level.

FHWA's Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate construction noise levels at the noise-sensitive land uses described above. Although the model was developed by FHWA, RCNM is often used for non-roadway projects, because the same types of construction equipment used for roadway projects are also used to construct other project types. Input variables for RCNM consist of the receiver/land use types, the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment (e.g., percentage of each hour the equipment typically works per day), and the distance between the construction activity and noise-sensitive receivers. No topographical or structural shielding was assumed in the modeling of construction noise (i.e., the receivers are modeled with no obstacles to the travel of sound between the construction activity and receiver location, which is a worst-case assumption).

The noise levels from the proposed construction activities are summarized in Table 20. The complete set of RCNM input and output data for construction noise is provided in Appendix I. As shown, at the nearest sensitive receptor (Calimesa Inn), noise levels would range from approximately 49 to 62 dBA L_{eq} when construction is taking place at or near the project site boundary. At the closest residences (approximately 975 feet north of the project, along Villa Calimesa and 7th Street) construction noise levels would range from approximately 68 to 78 dBA L_{eq} when construction is taking place at or near the project site boundary. According to the construction noise levels presented in Table 20 reported for the closest residences to the project, construction noise levels would be well below the maximum 75 dBA 8-hour average construction noise level (the 1-hour average of 78 dBA L_{eq} if held constant over an 8-hour work day would equate to a 78 dBA 8-hour average). Daytime construction noise levels would therefore be compliant with Calimesa Municipal Code Section 8.15.080.

Table 20. Construction Noise Model Results Summary Compared to Ambient

Construction Phase	Construction Noise at Representative Receivers (dBA L_{eq})		
	Calimesa Inn	Villa Calimesa/7th Street	Sandalwood East of Calimesa
Site Preparation	61	59	58
Grading	61	60	59
Building Construction	62	60	59
Paving	60	58	57
Architectural Coating	49	48	47
Ambient: Day/Night	**57/48**	**64/56**	**62/53**

Source: Appendix I.
Notes: dBA = A-weighted sound pressure level; L_{eq} = equivalent continuous sound level.

As presented in Table 20, the highest noise levels are predicted to occur during building construction when noise levels from construction activities would be as high as 62 dBA L_{eq} at the closest motel, and approximately 60 dBA L_{eq} at the closest residences. During the day, construction noise levels at vicinity noise-sensitive land uses would not be expected to exceed ambient noise levels by more than 5 dB. While the daytime construction noise could be noticeable, it would not be anticipated to disrupt normal activities at the residential properties or result in significant impacts, as it would be well below the 10 dB increase significance threshold. Therefore, daytime construction noise impacts would be less than significant. If construction occurred at night, the construction noise levels could be between 4 and 14 dB over ambient levels. At the high end of this range, not only would construction noise in the nighttime period be perceived as up to twice as loud as ambient noise, but the construction noise could result in sleep interruption in that period. Therefore, construction at night could result in potentially significant noise impacts. **MM NOI-1** would be required in order to reduce such impacts to less than significant.

With implementation of mitigation measure **MM NOI-1**, construction-related noise levels would not exceed any standards and would not be substantially higher than existing ambient noise levels (as shown in Table 20). Therefore, temporary construction-related noise impacts for the proposed project would be less than significant with mitigation incorporated.

Off-Site Traffic Noise

Less Than Significant Impact. The proposed project would generate traffic along adjacent roadways including 7th Street (from the project location southward), Sandalwood Drive, Calimesa Boulevard, 5th Street, and I-10. Potential noise effects from vehicular traffic were assessed using the FHWA Traffic Noise Model Version 2.5 (FHWA 2004). Information used in the model included the site geometry; posted traffic speeds for modeled roadways; and existing, existing plus project, background growth through 2022 without project, background growth through 2022 plus project, cumulative buildout without project, and cumulative buildout plus project traffic volumes (Appendix J-1).

Based upon roadway segments with project trip contributions, noise levels were modeled at representative noise-sensitive receivers including the Calimesa Inn (Calimesa Boulevard north of Sandalwood Drive), residences on the east side of Calimesa Boulevard south of Sandalwood Drive, and residences along Sandalwood Drive/5th Street east of Calimesa Boulevard. Note there are no sensitive receivers along 7th Street south of the project, and project traffic contributions to I-10 would be less than 1% of existing (and therefore would have no effect); therefore, traffic increases along these roadway segments were not modeled.

The receivers were modeled to be 5 feet above the local ground elevation. Spreadsheets containing the inputs and outputs for the traffic noise modeling are contained in Appendix J-1. The City does not have a specific criterion for evaluating the significance of project-related increases in off-site traffic noise levels at residences or noise-sensitive areas. For the purposes of this analysis, traffic noise level increases are considered significant if they exceed ambient traffic noise levels by three dB or more, or cause noise levels to exceed the 65 dBA CNEL noise threshold (where the noise level is not currently at 65 dBA CNEL). Noise levels in Table 21 are reported with values to the tenth of a decibel to demonstrate the very small changes in noise levels attributable to project traffic contributions; it is important to note the human ear cannot detect changes less than 1 dB. The noise model results are summarized in Table 21.

Table 21. Off-Site Traffic Noise Modeling Results

Modeled Receptor	Existing Noise Level (dBA CNEL)	Existing with Project Noise Level (dBA CNEL)	Back-ground Growth to 2020 Without Project (dBA CNEL)	Back-ground Growth to 2020 with Project (dBA CNEL)	Build-out Without Project Noise Level (dBA CNEL)	Build-out with Project Noise Level (dBA CNEL)	Maximum Project Related Noise Level Increase (dB)
Calimesa Inn	57.5	57.6	57.8	57.9	59.3	59.4	0.1
Sandalwood East of Calimesa	62.4	62.8	63.0	63.3	63.3	63.6	0.4
Calimesa South of Sandalwood	56.6	56.8	57.2	57.2	56.3	56.6	0.3

Source: Appendix I.
Notes: dBA = A-weighted sound pressure level; CNEL = community noise equivalent level.

Table 21 shows that the maximum noise level increase would be well below 1 dB. A change in noise level of 1 dB in an outdoor environment is not an audible change, in the context of community noise. Based upon these results, off-site traffic noise impacts associated with the proposed project would be less than significant. No mitigation is required.

On-Site Operational Noise

Less Than Significant Impact. A Dudek-proprietary noise prediction model using Microsoft Excel was used to predict the aggregate sound propagation from the Sandalwood Travel Center Project's major anticipated stationary producers of noise emissions. The outdoor noise propagation formulas incorporated into the Excel-based spreadsheet model adhere to several accepted standards, including the International Organization of Standardization Standard 9613-2, "Attenuation of Sound During Propagation Outdoors, Part 2: General Method of Calculation" (ISO 1996). The stationary noise model was set up to predict the hourly average (L_{eq} hour) noise levels from facility operation, which assumes all noise sources are continuously operating for the entire hour (which is conservative). In addition, structures or topography present between the project site and surrounding receiver areas are not included in the model, which again produces very conservative results.

Table 22 presents the reference sound levels for the individual sources considered in the on-site stationary noise prediction model.

Table 22. Stationary Noise Prediction Model Source Sound Levels

Source	Reference Sound Pressure Level (dBA)	Distance (in Feet) for Reported Sound Pressure
Truck Parking/Maneuver Area[a]	66	35
Retail Parking Lot[b]	47	3.3
Trane 5-Ton HVAC package unit[c]	64	3.3
Gas/Diesel Dispenser[d]	65	3

Sources:
[a] Mestre Greve Associates.
[b] Journal of Environmental Engineering and Landscape Management.
[c] Trane.
[d] Noise Navigator™ Sound Level Database.
Note: dBA = A-weighted sound pressure level.

Figure 7, Operational Noise, illustrates the predicted noise contours extending outward from the project site, based upon the above-described stationary noise modeling. Noise levels from 60 to 70 dBA L_{eq} (suitable for commercial land uses) would be limited to the project site, adjacent roadway rights-of-way (including I-10 and 7th Street), and up to approximately 60 feet north from the northern project boundary (an area with current ambient noise levels already up to approximately 70 dBA CNEL associated with I-10).

With regard to project stationary noise levels at vicinity noise-sensitive land uses, the modeling predicts that operational noise levels at the closest noise-sensitive receivers would be no greater than 35 to 40 dBA L_{eq}. Project operational noise levels would therefore be well below municipal code limits for non-transportation sources affecting residential land uses of 65 dBA (daytime) and 55 dBA (nighttime). Operational noise levels would also be less than the ambient noise levels during daytime and nighttime periods at the selected noise-sensitive receivers addressed with the modeling. Therefore, project stationary noise levels would result in less than significant noise impacts.

Mitigation Measures

MM NOI-1 Construction activities for the project shall take place during the permitted time and day per Chapter 8.15.080 of the City's Municipal Code. The applicant shall ensure that construction activities are limited to the hours between 7:00 a.m. and 7:00 p.m. weekdays and between 10:00 a.m. and 5:00 p.m. on Saturdays and Sundays and federal holidays. This condition shall be listed on the final construction plans for the proposed project to the satisfaction of the City of Calimesa Planning Department.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Less Than Significant Impact. The main concern associated with ground-borne vibration is annoyance; however, in extreme cases, vibration can cause damage to buildings, particularly those that are old or otherwise fragile. Some common sources of ground-borne vibration are trains, and construction activities such as blasting, pile-driving, and heavy earthmoving equipment. The proposed project would not generate any substantial long-term (operational) new sources of vibration; the primary source of ground-borne vibration occurring as part of the proposed project would be short-term construction activity.

Ground-borne vibration information related to construction activities has been collected by Caltrans (Caltrans 2020). Information from Caltrans indicates that transient vibrations (such as construction activity)

of approximately 0.035 inches per second (in/sec) peak particle velocity (PPV) may be characterized as barely perceptible, and vibration levels of 0.24 in/sec PPV may be characterized as distinctly perceptible by people. Caltrans identifies a threshold for structural building damage, which typically occurs at vibration levels of 0.5 in/sec PPV or greater for buildings of reinforced-concrete, steel, or timber construction, or 0.2 in/sec PPV for typical residential construction.

The most important equipment relative to generation of vibration, and the vibration levels produced by such equipment, is illustrated in Table 23. Large bulldozers and loaded trucks would produce the highest level of vibration during construction of the proposed project. The closest noise-sensitive receiver (a motel) to the construction area for the project is approximately 835 feet away (east of I-10), while the closest residences are approximately 975 feet (north) and 1,085 feet (east).

Table 23. Vibration Velocities for Typical Construction Equipment

Equipment	PPV at 25 Feet (Inches Per Second)
Large Bulldozer	0.089
Loaded Trucks	0.076
Drill Rig/Auger	0.089
Jackhammer	0.035
Small Bulldozer	0.003

Source: Caltrans 2013.
Note: PPV = peak particle velocity.

As shown in Table 23, a large bulldozer generates vibration levels of 0.089 in/sec PPV at a distance of 25 feet, while a loaded truck generates vibration levels of 0.076 in/sec PPV at a distance of 25 feet. The existing commercial structure on the adjacent parcel to the south would be no closer than 25 feet from the boundary of the project construction activity. Therefore, ground vibration from the project construction would remain well below the damage threshold of 0.5 in/sec PPV for commercial structures. The nearest residences to the project construction activity would be approximately 975 feet from ground disturbance (use of a bulldozer) and could experience vibration levels of 0.0004 inches per second PPV during bulldozer operations. Vibration levels at these residential receptors would not exceed the Caltrans building damage threshold of 0.2 inches per second PPV for even fragile or historic structures. These vibration levels would also be well below the level considered barely perceptible to people (0.035 in/sec PPV), and therefore should generally not be discernible to area residents. While some people who are particularly sensitive to vibration may perceive some vibration episodes during certain construction activities, vibration levels would not be anticipated to reach annoyance levels for residents in the vicinity of the project. Ground-borne vibration would not be associated with the proposed project following construction activities. Impacts related to ground-borne vibration would be less than significant. No mitigation is required.

c) ***For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?***

No Impact. The proposed project would not expose people residing or visiting in the project area to excessive noise levels from aircraft. The nearest public airports are Redlands Municipal Airport (8 miles northwest) and Banning Municipal Airport (12.5 miles southeast). There are no private airports in the vicinity of the project site. As such, no impacts from airport/aircraft noise would occur. No mitigation is required.

3.14 Population and Housing

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIV. POPULATION AND HOUSING – Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to population and housing on the northern parcels and/or the surrounding areas. Any future development proposed on the northern parcels would be subject to a separate analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) ***Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?***

Less Than Significant Impact. The proposed development project would include development of the site in accordance with the land use designation applied to the site by the City of Calimesa General Plan (i.e., Community Commercial). While the proposed development project would generate new employment opportunities (15 employees), the proposed project would not result in growth that was not already anticipated by the City and evaluated in the SCAG RTP/SCS. Furthermore, the development project site is served by existing public roadways and utility infrastructure already installed beneath public right-of-way that abuts the property. Accordingly, the proposed development project would not induce direct or indirect substantial growth in the area, and impacts would be less than significant.

b) ***Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?***

No Impact. The development project site is composed of vacant, disturbed land. As such, development of the proposed project would not displace any people or substantial numbers of housing and would not necessitate the construction of replacement housing elsewhere. No impact would occur.

3.15 Public Services

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XV. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
i) Fire protection?	☐	☐	☒	☐
ii) Police protection?	☐	☐	☒	☐
iii) Schools?	☐	☐	☐	☒
iv) Parks?	☐	☐	☐	☒
v) Other public facilities?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to public services on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) ***Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:***

Fire protection?

Less Than Significant Impact. Fire protection services with the City are provided by the City's Fire Department, established in 2017. Prior to establishment of the City's Fire Department, the City contracted with Riverside County for fire services since its incorporation in 1990. The City is served by the Calimesa Fire Station, located approximately 0.6 miles northeast of the project site, at 906 Park Avenue.

Although implementation of the development project would not involve new residential uses or an increase in the City's population, the operation of new commercial uses would increase the demand for fire protection, prevention, and emergency medical services at the currently undeveloped project site. The development project would create the typical range of service calls for commercial developments, such as medical aid, fire response, traffic collisions, and hazardous materials. The proposed development project has been designed in compliance with all applicable ordinances and standard conditions established by the City and state including, but not limited to, those regarding fire prevention and suppression measures, such as fire hydrants, fire access, emergency exits, combustible construction, fire flow, and fire sprinkler systems. Compliance with applicable regulations would be confirmed by the Fire Department during its review of development plans to ensure it has the capacity to provide proper fire protection to the development.

The development of the proposed development project would not cause fire staffing, facilities, or equipment to operate at a deficient level of service. In addition, the development applicant would be required to pay Developer Impact Fees, which provides a funding source for construction of fire facilities as a result of impacts related to future growth in the City. The proposed development project would create an incremental demand for fire protection services but would not require the construction of new or expanded fire protection facilities. Therefore, impacts would be less than significant.

Police protection?

Less Than Significant Impact. The City of Calimesa provides law enforcement services through a service contract with the Riverside County Sheriff's Department. The County Sheriff's station providing services to the Calimesa area is located at 50290 Main Street in Cabazon. The Cabazon Station also serves the unincorporated pass area around Beaumont and Banning, and the unincorporated areas of Cabazon, Cherry Valley, Poppet Flats, San Gorgonio, San Timoteo Canyon, Twin Pines, and Whitewater (City of Calimesa 2014d).

The proposed development project would introduce a travel center, including employees and visitors to the project site. Proposed development would result in an incremental increase in demand for police protection services, but it is not anticipated to require or result in the construction of new or physically altered police facilities. Furthermore, the development applicant would be required to contribute Developer Impact Fees, which would ensure the proposed project, would provide fair share funds for the provision of additional police protection services, which may be applied to sheriff facilities and/or equipment, to offset the incremental increase in the demand that would be created by the project. Therefore, the proposed development project's incremental demand for sheriff protection services would be less than significant with the development applicant's mandatory payment of Developer Impact Fees.

Schools?

No Impact. The development project site is within the Yucaipa–Calimesa Joint Unified School District. The proposed development project would not create a direct demand for school services, as the project involves non-residential uses that would not generate any school-aged children. The proposed development project would generate a minimal number of employment opportunities, and it is expected these positions would be filled by the local labor force. Therefore, the proposed development project would not generate a substantial number of new residents nor generate school-aged students requiring public education. As such, the development project would not cause or contribute to a need to construct new or physically altered public school facilities.

Although the proposed project would not create a direct demand for additional public school services, the development applicant would be required to contribute developer fees to the Yucaipa–Calimesa Joint Unified School District in compliance with Section 65995(b) of the California Government Code. Payment of developer fees allows the school district to collect fees from new developments to offset the costs associated with increasing school capacity needs. Mandatory payment of developer fees would be required prior to the issuance of building permits, and no impact would occur.

Parks?

No Impact. The proposed project does not include construction of new residential uses that could result in population growth within the City of Calimesa. Thus, the proposed project would not create a demand for public park facilities and would not result in the need to modify existing or construct new park facilities. Accordingly, implementation of the proposed project would not adversely affect any park facility and no impact would occur.

Other public facilities?

No Impact. The proposed development project does not include construction of new residential uses that could result in population growth within the City of Calimesa. Thus, the proposed development project would not create a demand for other public facilities/services, including libraries, community recreation centers, public health facilities, and/or animal shelters. As such, implementation of the proposed development project would not adversely affect other public facilities or require the construction of new or modified public facilities; no impact would occur

3.16 Recreation

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVI. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to the northern parcels and/or the surrounding areas. Any future development proposed on the northern parcels would be subject to a separate analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

No Impact. The proposed development project would include development of Community Commercial land uses. The proposed project does not propose any type of residential use or other land use that would generate population growth that would increase the use of existing neighborhood and regional parks or other recreational facilities. Accordingly, implementation of the proposed development project would not result in construction or expansion of recreational facilities and no impact would occur.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Impact. The proposed development project does not include construction of any new on- or off-site recreation facilities. In addition, the proposed development project would not include expansion of any existing off-site recreational facilities. Accordingly, implementation of the proposed project would not result in the increased use or substantial physical deterioration of an existing neighborhood or regional park; no impact would occur.

3.17 Transportation

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVII. TRANSPORTATION – Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☐	☐	☒	☐
b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?	☐	☐	☒	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☐	☒
d) Result in inadequate emergency access?	☐	☐	☒	☐

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to transportation on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate transportation analysis and associated CEQA process as determined by the City. The following analysis focuses only on the proposed Sandalwood Travel Center development on Parcel 3, based on the TIA prepared for the proposed development project (Appendix J-1) and a follow-up Trip Generation Comparison Analysis (Appendix J-2). In addition, the TIA and Trip Generation Comparison analysis were reviewed and Ganddini provided detailed responses to City comments contained in Appendix J-3.

The transportation study area consists of intersections where the proposed development project is expected to contribute 50 or more peak hour trips with classification of “Collector” or “Collector” and above, that are all located within the City of Calimesa and Caltrans jurisdictions. Table 24 summarizes the study area intersections analyzed in the TIA.

Table 24. Transportation Study Area

Study Intersections	Jurisdiction
1. 7th Street at Project North Driveway	City of Calimesa
2. 7th Street at Project Central Driveway	City of Calimesa

Table 24. Transportation Study Area

Study Intersections	Jurisdiction
3. 7th Street at Project South Driveway	City of Calimesa
4. 7th Street at Sandalwood Drive	City of Calimesa
5. I-10 SB Ramps at Sandalwood Drive	Caltrans
6. I-10 NB On-Ramp at Sandalwood Drive	Caltrans
7. Calimesa Blvd at Sandalwood Drive	City of Calimesa
8. I-10 NB Off-Ramp at Calimesa Boulevard	Caltrans

Source: Appendix J-1.
Notes: SB = southbound; Caltrans = California Department of Transportation; NB = northbound.

To assess the performance of an intersection, the City of Calimesa uses the intersection delay method based on procedures contained in the Highway Capacity Manual (NASEM 2022). Level of service (LOS) analysis is performed for assessing General Plan operational conformance within the approving agency's discretionary authority. The intersection control delay is then correlated to LOS based on the thresholds included in Table 25.

Table 25. Level of Service Thresholds

Level of Service	Intersection Control Delay (Seconds/Vehicle)	
	Signalized Intersection	Unsignalized Intersection
A	≤ 10.0	≤ 10.0
B	> 10.0 to ≤ 20.0	> 10.0 to ≤ 15.0
C	> 20.0 to ≤ 35.0	> 15.0 to ≤ 25.0
D	> 35.0 to ≤ 55.0	> 25.0 to ≤ 35.0
E	> 55.0 to ≤ 80.0	> 35.0 to ≤ 50.0
F	> 80.0	> 50.0

Source: Appendix J-1.

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

Less Than Significant Impact. The proposed development project would be designed to comply with applicable plans, ordinances and policies that establish measures of effectiveness for the performance of the circulation system. The proposed project is forecast to generate a total of approximately 2,658 daily trips, including 243 trips during the AM peak hour and 220 trips during the PM peak hour (Appendix J-2). Table 26 includes a summary of the intersection LOS analysis for each scenario evaluated in the TIA.

Table 26. Summary of Intersection Level of Service

Study Intersection	Peak Hour Delay – LOS[1,2,3]									
	Existing		Background Conditions		Background Conditions Plus Project		Cumulative No Project		Cumulative Plus Project	
	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM
1. 7th Street at Project North Driveway	—	—	—	—	10.6-B	10.6-B	—	—	10.3-B	11.7-B

Table 26. Summary of Intersection Level of Service

Study Intersection	Peak Hour Delay – LOS[1,2,3]									
	Existing		Background Conditions		Background Conditions Plus Project		Cumulative No Project		Cumulative Plus Project	
	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM
2. 7th Street at Project Central Driveway	—	—	—	—	10.9-B	10.8-B	—	—	10.4-B	11.5-B
3. 7th Street at Project South Driveway	—	—	—	—	0-A	0-A	—	—	0-A	0-A
4. 7th Street at Sandalwood Drive	8.4-A	7.9-A	9.3-A	9-A	11-B	10.4-B	1.9-A	4.7-A	4.4-A	7.5-A
5. I-10 South-Bound Ramps at Sandalwood Drive	14.5-B	11.2-B	17.5-C	13.7-B	25.4-D	17.7-C	19.3-B	20.9-C	18.6-B	21.6-C
6. I-10 North-Bound On-Ramp at Sandalwood Drive	10.8-B	8.9-A	11.9-B	9.5-A	13.1-B	10.2-B	0-A	0-A	0-A	0-A
7. Calimesa Boulevard at Sandalwood Drive	26.3-C	19.4-B	27.4-C	20.5-C	28.6-C	21.4-C	27.9-C	43-D	29.6-C	53.5-D
8. I-10 North-Bound Off-Ramp at Calimesa Blvd	17.5-C	9.6-A	23.1-C	10.5-B	32-D	11.3-B	29.3-C	41.9-D	32.9-C	50.4-D

Source: Appendix J-1.
Notes:
1 Delay is shown in seconds per vehicle. For intersections with traffic-signal or all-way stop control, overall average intersection delay and LOS are shown. For intersections with cross-street stop control, LOS is based on average delay of the worst individual lane (or movements sharing a lane).
2 LOS = Level of Service
3 LOS is based on a higher trip generation analyzed in the Traffic Impact Assessment (Appendix J-1), and therefore represents a conservative analysis.

As shown in Table 26, the TIA prepared for the project concluded that the proposed development project would not result in additional intersection delays that would exceed the City's minimum peak hour LOS D, established by General Plan Policy TM-7. Impacts would be less than significant.

b) Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Less Than Significant Impact. In the fall of 2013, SB 743 was passed by the legislature and signed into law by the Governor. Delay-based metrics such as roadway capacity and level of service are no longer the performance measures used for the determination of the transportation impacts of projects in studies conducted under CEQA. Vehicle miles traveled (VMT) is now the applicable method for evaluation transportation impacts under CEQA.

A VMT assessment was performed as part of the TIA prepared for the proposed development project. The Calimesa Transportation Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment state that the following activities generally will not require detailed VMT analysis based on substantial evidence provided in the OPR Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR 2018) supporting SB 743 implementation or are related to projects that are local serving which, by

definition, would decrease the number of trips or the distance those trips travel to access the development (and are therefore VMT reducing projects):

- Projects located in a Transit Priority Area (TPA) (as defined in the City guidelines)
- Projects located in a low-VMT-generating area (as defined later in the City guidelines)
- Local-serving K–12 schools
- Local parks
- Daycare centers
- Local-serving gas stations
- Local-serving banks
- Local-serving hotels (e.g., non-destination hotels)
- Student housing projects
- Local-serving medical facilities
- Local-serving community colleges that are consistent with the assumptions noted in the RTP/SCS
- Projects generating fewer than 110 daily vehicle trips. This generally corresponds to the following "typical" development potentials:
  - 11 single-family housing units
  - 16 multi-family, condominium, or townhouse housing units
  - 10,000 square feet of office
  - 15,000 square feet of light industrial
  - 63,000 square feet of warehousing
  - 79,000 square feet of high-cube transload and short-term storage warehouse

The Technical Advisory contains guidance indicating that local-serving retail, defined as less than 50,000 square feet, would typically shorten trips and reduce VMT. New retail development typically redistributes shopping trips rather than creating new trips. By adding retail opportunities into the urban fabric and thereby improving proximity, local-serving retail tends to shorten trips and reduce VMT.

The development project proposes local-serving retail uses that include fueling dispensers, a convenience store with a drive-through, and a common area for customers. The proposed development project is a travel center totaling less than 50,000 square feet. Furthermore, the proposed development project would introduce a new opportunity for such services in the community and thereby shorten the distance that patrons would otherwise travel to other similar uses. Therefore, the proposed development project meets the screening criteria from the City of Calimesa and the Technical Advisory for presumption of a less than significant VMT impact for local-serving gas station and retail uses.

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

No Impact. The proposed development project would be accessible from 7th Street. The development project would include on-site circulation improvements (driveways and internal drive aisles) and frontage improvements along the project boundary. These on-site and adjacent improvements would be designed in accordance with all applicable design standards set forth by the City. The design will undergo City and Fire

Department review before approval to ensure that the local development standards for roadways are met without resulting in traffic safety impacts including hazardous design features. The development project would not include sharp curves or dangerous intersections.

The Site Distance Analysis on 7th Street included in the TIA concluded that vehicles traveling along 7th Street would have adequate vertical sight distance to avoid collisions with vehicles accessing the development project site. Based on the above analysis, the proposed development project would not substantially increase hazards due to a geometric design feature or incompatible uses and no impact would occur.

d) Would the project result in inadequate emergency access?

Less Than Significant Impact. The project site would be accessible to emergency responders during construction and operation of the proposed development project. As discussed previously, the project site would be accessible via driveways along 7th Street. Each of the proposed driveways would be designed and constructed to City standards and comply with City width, clearance, and turning-radius requirements. Development of three driveway access points and compliance with all applicable local requirements related to emergency vehicle access and circulation would ensure the proposed development project would not result in inadequate emergency access. Impacts would be less than significant.

3.18 Tribal Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVIII. TRIBAL CULTURAL RESOURCES				
Would the project cause a substantial adverse change in the significance of a Tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or	☐	☒	☐	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.	☐	☒	☐	☐

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts to Tribal cultural resources (TCRs) on the northern parcels. Any future development proposed on

the northern parcels would be subject to a separate TCR analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3, based, in part, on the Cultural Resources Survey Report (Appendix C). In addition, and also pursuant to AB 52, the analysis also relies on correspondence between the City and all NAHC-listed traditionally geographically affiliated Tribal representatives that requested project notification.

Native American Heritage Commission

HELIX contacted the NAHC on December 8, 2020, and requested a review of the Sacred Lands File. The NAHC responded on December 22, 2020, that the results of the search were negative through the absence of site-specific information. However, the NAHC also noted that the absence of site-specific information does not indicate that there is an absence of cultural resources within the project area. The NAHC provided a list of 19 additional Native American individuals and/or Tribal organizations who may have direct knowledge of cultural resources in or near the proposed project site. HELIX submitted letters to the Native American representatives and interested parties identified by the NAHC on February 5, 2021, to request additional information. Three Tribes—the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians), Fort Yuma Quechan Indian Tribe, and Agua Caliente Band of Cahuilla Indians—provided responses. The Yuhaaviatam's initial response, dated February 21, 2021, stated that although the project is located within Serrano ancestral territory, the area is not of great concern to the Yuhaaviatam. Later this tribe provided input on the proposed mitigation measures. The Fort Yuma Quechan Indian Tribe's response, dated February 8, 2021, did not have comments on the proposed and deferred to more local Tribes. The Agua Caliente Band of Cahuilla Indians' response, dated March 11, 2021, stated that the project site is within the Tribe's Traditional Use Area and therefore required a cultural resources inventory of the project area by a qualified archaeologist prior to any development activities in this area, a copy of the records search with associated survey reports and site records from the information center, and copies of any cultural resource documentation (report and site records) generated in connection with the project.

Assembly Bill 52

AB 52 of 2014 amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that TCRs must be considered under CEQA and provided for additional Native American consultation requirements for the lead agency. PRC Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe. A TCR is either:

- On the California Register of Historical Resources or a local historic register;
- Eligible for the California Register of Historical Resources or a local historic register; or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1.

AB 52 formalizes the lead agency–Tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project area, including Tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report by contacting those Tribal groups who have previously provided formal written request for notification of projects under the agency's jurisdiction.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a TCR has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to

the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a TCR or alternatives that would avoid significant impacts to a TCR." Furthermore, if a California Native American Tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to TCRs, the consultation shall include those topics (PRC Section 21080.3.2[a]). Finally, the environmental document, for which the Tribal consultation is focused, and the mitigation monitoring and reporting program (where applicable), developed in consideration of information provided by Tribes during the formal consultation process, shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

Assembly Bill 52 Consultation

All NAHC-listed California Native American Tribal representatives that have requested project notification pursuant to AB 52 were sent letters by the City in July 2021, via U.S. Postal Service certified mailing and email. The notification letters contained a project description, outline of AB 52 timing, an invitation to consult, a project site plan, and contact information for the appropriate lead agency representative. At the time of preparation of this IS/MND, only the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) responded. **MM CUL-1, MM CUL-2, MM TCR-1**, and **MM TCR-2** have been prepared in part based on Yuhaaviatam input. No other Tribes responded, and the AB 52 consultation process has concluded.

Would the project cause a substantial adverse change in the significance of a Tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?

Less Than Significant Impact with Mitigation Incorporated. As described in Section 3.5(b), the Cultural Resources Survey Report (Appendix C) identified six known cultural resources within the 0.5-mile radius of the project site, all of which date to the historic period. None of the identified resources are located within the development project site. However, two resources, P-33-01529 and P-33-015300, were previously identified adjacent to the development project site. As described in Section 3.5(b), P-33-015299 is a historic isolate containing two glass bottle fragments and a scattering of porcelain plate fragments located within the northern half of APN 411-210-024. P-33-015300 was identified directly adjacent to the project site and consists of an electric utility line held up by nine wooden poles that were erected in 1940. The remaining four resources located within 0.5 miles of the development project site consist of a historic site with a water retention feature (P-33-013993); a historic site containing a structural foundation (P-33-013995); a historic site containing a single-family residence, detached garage, and a wood barn (P-33-016792); and a historic site containing a two-story vernacular farmhouse, a secondary two-story vernacular barn/residence, a wooden chicken coop, and a corrugated metal barn (P-33-016793). However, these resources are historic-era resources and were not located within the project site.

There is also potential for inadvertent discovery of TCRs during ground-disturbing construction activities. In compliance with AB 52, the City also contacted all NAHC-listed traditionally geographically affiliated Tribal representatives that have requested project notification. Subsequent to their response to HELIX, the Yuhaaviatam sent an email to the City on August 2, 2021, stating that the project area is of interest to their Tribe, and provided language with a request for this language to be incorporated into the cultural resources and/or the TCRs mitigation measures. The City's AB 52 process is concluded.

MM CUL-1 and **MM CUL-2**, as discussed in Section 3.5, would be implemented during construction of the development project in the event of an inadvertent discovery of archaeological resources to allow for assessment and evaluation of the resources. Please refer to Section 3.5 for the full text of **MM CUL-1** and **MM CUL-2**. Furthermore, **MM CUL-2** contains the protocol to be implemented should construction activities uncover human remains. In conclusion, with the implementation of **MM CUL-1**, **MM CUL-2**, **MM TCR-1**, and **MM TCR-2**, impacts to historical resources would be less than significant.

Mitigation Measures

MM TCR-1 The San Manuel Band of Mission Indians Cultural Resources Department (SMBMI) shall be contacted, as detailed in **MM CUL-1**, upon discovery of any pre-contact and/or historic-era cultural resources during project implementation, and shall be provided information regarding the nature of the find to inform and allow Tribal input with regard to significance and treatment. Should the find be deemed significant, as defined by the California Environmental Quality Act (as amended, 2015), a cultural resources Monitoring and Treatment Plan shall be created by a qualified archaeologist, in coordination with SMBMI, and all subsequent finds shall be subject to this Monitoring and Treatment Plan. This Monitoring and Treatment Plan shall allow for a monitor to be present that represents SMBMI for the remainder of the project, should SMBMI elect to place a monitor on site.

MM TCR-2 Any and all archaeological/cultural documents created as a part of the project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the applicant and the lead agency for dissemination to SMBMI. The lead agency and/or applicant shall, in good faith, consult with SMBMI throughout the life of the project.

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.

Less Than Significant Impact with Mitigation Incorporated. The project is subject to compliance with AB 52 (PRC 21074), which requires consideration of impacts to TCRs as part of the CEQA process and requires lead agencies to provide notification of proposed projects to California Native American Tribal representatives that have requested such notifications.

The Yuhaaviatam consulted with the City under AB 52 and requested that mitigation measures be included for the project permit and planning. This language has been incorporated into **MM CUL-1** and **MM CUL-2,** as discussed in Section 3.5, and would be implemented during construction of the development project in the event of an inadvertent discovery of archaeological and/or TCRs to allow for assessment and evaluation of the resources. Furthermore, **MM CUL-2** contains the protocol to be implemented should construction activities uncover human remains. In conclusion, with the implementation of **MM CUL-1**, **MM CUL-2**, **MM TCR-1**, and **MM TCR-2**, impacts related to an unknown TCR would be reduced to less than significant with mitigation incorporated.

3.19 Utilities and Service Systems

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XIX. UTILITIES AND SERVICE SYSTEMS – Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☒	☐
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to utilities and service systems on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) ***Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?***

Less Than Significant Impact. The proposed development project would include the construction of an on-site network consisting of water, sewer, drainage, natural gas, telecommunications, and electric facilities that would connect to existing facilities adjacent to or within the development project site. The development project would also construct an on-site network of water, sewer, drainage, natural gas, telecommunications, and electric facilities that would connect to existing facilities within 7th Street. The installation of utility connections as proposed by the development project would result in physical impacts on site and adjacent to the site for connections; however, these impacts are considered to be part of the development project's

construction phase and are evaluated throughout this IS/MND accordingly. As identified throughout this IS/MND, no significant impacts have been identified for the development project's construction phase, and no mitigation is required. The construction of on-site utilities necessary to serve the development project would not result in any significant physical effects on the environment that are not already identified and disclosed as part of this IS/MND; therefore, impacts would be less than significant.

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

Less Than Significant Impact. The Yucaipa Valley Water District would provide domestic water services to the development project site. The City is primarily served by groundwater from the San Timoteo Subbasin of the Beaumont Groundwater Basin (City of Calimesa 2014d). The sub basin is bounded to the north and northeast by the Banning Fault and impermeable rocks of the San Bernardino Mountains, Crafton Hills, and Yucaipa Hills; on the south by the San Jacinto Fault; on the west by the San Jacinto Mountains; and on the east by a topographic drainage divide with the Colorado River hydrologic region. The surface is drained by Little San Gorgonio Creek and San Timoteo Canyon to the Santa Ana River (SBVMWD 2016). Groundwater for the San Timoteo Subbasin is replenished by subsurface inflow and percolation of precipitation, runoff, wastewater discharge, and imported water. Runoff and imported water are delivered to streambeds and spreading grounds for percolation. The San Timoteo Subbasin is not adjudicated, and reliable estimates of total groundwater extractions are not available. However, water table elevations within the San Timoteo Subbasin have not declined over the years (SBVMWD 2016).

Due to the size of the development project, the availability of groundwater as part of the City's water supply would provide adequate water supply to serve the proposed project, and impacts would be less than significant.

c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less Than Significant Impact. The Yucaipa Valley Water District provides wastewater services for the City. The Yucaipa Valley Water District operates and maintains 205 miles of sewer pipelines and five sewer lift stations. The Wochholz Regional Water Recycling Facility was recently expanded to a capacity of 8.0 million gallons per day to accommodate future anticipated population growth and development. The ultimate facility will be capable of treating up to 11 million gallons per day of wastewater (County of San Bernardino 2015).

Wastewater generated by the proposed development project would mainly consist of effluent typical of commercial uses permitted within the C-C zoning designation. None of the proposed uses would generate atypical wastewater, such as industrial or agricultural effluent. All wastewater generated by the development project is expected to be domestic sewage. In addition, the proposed development project would be required to comply with all applicable regulations and standards, including the NPDES permit requirements and RWQCB standards. As such, the expanded Wochholz Regional Water Recycling Facility would have adequate capacity to serve the proposed development project, because the project wastewater generation would be consistent with the permitted land use and the Yucaipa Valley Water District provided a will-serve letter indicating there is adequate treatment capacity to serve the development project. Therefore, impacts would be less than significant.

d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less Than Significant Impact. Implementation of the proposed project would generate an incremental increase in solid waste volumes requiring off-site disposal during short-term construction and long-term operational activities. The proposed development project would be required to comply with mandatory waste reduction requirements as described in Section 3.19(e). Solid waste generated by the project would be disposed of at either the Badlands Landfill or El Sobrante Landfill. El Sobrante Landfill is permitted to receive 16,054 tons per day (CalRecycle 2021). The Badlands Landfill is permitted to receive 4,800 tons per day (CalRecycle 2021). The development project's potential to exceed the capacity of landfills during construction and operation is discussed below.

Solid waste requiring disposal would be generated during the construction of the development project, primarily consisting of discarded materials and packaging. Based on the size of the development project (i.e., 7,764-square-foot building area) and the EPA's construction waste generation factor of 4.34 pounds per square foot for non-residential uses, approximately 16.8 tons of waste is expected to be generated during the project's construction phase ([7,764 square feet × 4.34 pounds per square foot] / 2,000 pounds per ton = 16.8 tons) (EPA 2009). In compliance with the CALGreen Code, a minimum of 65% of all solid waste must be diverted from landfills (by recycling, reusing, and other waste reduction strategies). Therefore, the development project is estimated to generate approximately 5.9 tons of solid waste during its construction phase, which would be disposed of in nearby landfills. Based on the construction schedule established for analysis purposes, the development project's construction phase is estimated to last for approximately 365 days; therefore, the development project is estimated to generate approximately 0.02 tons of solid waste per day requiring landfill disposal during construction.

Non-recyclable construction waste generated by the development project would be disposed of at El Sobrante Landfill and/or the Badlands Landfill. As described above, these landfills receive well below their maximum permitted daily disposal volume; thus, the relatively minimal construction waste generated by the development project is not anticipated to cause either landfill to exceed its maximum permitted daily disposal volume. Furthermore, El Sobrante Landfill and the Badlands Landfill are not expected to reach their total maximum permitted disposal capacities during the development project's construction period. El Sobrante Landfill and the Badlands Landfill have sufficient daily capacity to accept solid waste generated by the development project's construction phase.

In summary, construction and operation of the proposed project would not result in the generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Therefore, impacts would be less than significant.

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. Federal, state, and local statutes and regulations regarding solid waste generation, transport, and disposal are intended to decrease solid waste generation through mandatory reductions in solid waste quantities (e.g., through recycling and composting of green waste) and the safe and efficient transport of solid waste. The development project would be required to coordinate with CR&R Waste Services to develop a collection program for recyclables, such as paper, plastics, glass, and aluminum, in accordance with local and state programs, including AB 341, Mandatory Commercial

Recycling, and the California Solid Waste Reuse and Recycling Act of 1991. In addition, the development project would be required to comply with applicable practices enacted by the City under the California Integrated Waste Management Act of 1989 (AB 939) and any other applicable local, state, and federal solid waste management regulations. AB 939 required that local jurisdictions divert at least 50% of all solid waste generated by January 1, 2000. The diversion goal has been increased to 75% by 2020 by SB 341. During construction and operation of the proposed development project, all applicable federal, state, and local agency regulations related to solid waste reduction must be complied with; therefore, impacts would be less than significant.

3.20 Wildfire

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XX. WILDFIRE – If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to wildfire on the northern parcels. Any future development proposed on the northern parcels would be subject to a separate wildfire analysis and associated CEQA process as determined by the City. The following analysis focuses only on the Sandalwood Travel Center development on Parcel 3.

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

No Impact. The project site is not located within 1 mile of any State Responsibility Areas (SRAs) or land classified as a Very High Fire Hazards Severity Zone in an LRA (CAL FIRE 2009). In addition, as discussed in Section 3.9, Hazards and Hazardous Materials, the proposed development project does not include any characteristics (e.g., temporary or permanent road closures or the long-term blocking of road access) that

would physically impair or otherwise conflict with an adopted emergency response plan or emergency evacuation plan. Therefore, no impact would occur.

b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact. The project site is not located within 1 mile of any SRAs or land classified as a Very High Fire Hazards Severity Zone in a LRA (CAL FIRE 2009). Therefore, no impact would occur.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact. The project site is not located within 1 mile of any SRAs or land classified as a Very High Fire Hazards Severity Zone in a LRA (CAL FIRE 2009). Therefore, no impact would occur.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. The project site is not located within 1 mile of any SRAs or land classified as a Very High Fire Hazards Severity Zone in a LRA (CAL FIRE 2009). In addition, as previously discussed in Section 3.7, Geology and Soils, landslides or other forms of natural slope instability do not represent a significant hazard to the project because the project site is located in a relatively flat area. Therefore, no impact would occur.

3.21 Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Does the project have impacts that are individually limited, but cumulatively considerable ("cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☒	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☒	☐	☐

As discussed throughout this document, TPM 38215 would not result in any physical environmental changes on the northern parcels; therefore, it would not result in impacts relative to the northern parcels. Any future development proposed on the northern parcels would be subject to a separate analysis and associated CEQA process as determined by the City. The following mandatory findings are focused only on the Sandalwood Travel Center development on Parcel 3.

a) ***Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?***

Less Than Significant Impact with Mitigation Incorporated. To reduce impacts to nesting birds during construction, **MM BIO-2** would be implemented, which requires a nesting bird survey prior to any ground disturbance as well as the establishment of exclusion buffers depending on the bird species present. In addition, as described in Sections 3.4.2(a), 3.4.2(d), and 3.4.2(f), the project site is located within the MSHCP Plan Area Subunit 2 (Badlands/San Bernardino National Forest) Cells 323 and 326. Although potentially suitable BUOW habitat was identified, no suitable burrows or burrow surrogates were identified on Parcel 3. BUOW is not expected to occur on the development project site. However, potential impacts to BUOW would be minimized through implementation of **MM BIO-1**. **MM BIO-3** includes mitigation for impacts related to the 2009 grading activities and **MM BIO-4** includes the MSHCP landscaping restrictions.

Impacts to archaeological resources, human remains, and TCRs that may be buried in site soils were determined to be potentially significant without mitigation. Such impacts would be less than significant after implementation of mitigation measures **MM CUL-1** and **MM CUL-2**.

Additionally, impacts to paleontological resources that may be buried in site soils were determined to be potentially significant without mitigation. Such impacts would be less than significant after implementation of mitigation measure **MM GEO-1**.

b) Does the project have impacts that are individually limited, but cumulatively considerable ("cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less Than Significant Impact with Mitigation Incorporated. When evaluating cumulative impacts, it is important to remain consistent with Section 15064(h) of the CEQA Guidelines, which states that an EIR must be prepared if the cumulative impact may be significant and the project's incremental effect, though individually limited, is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. Cumulative impacts refer to individual effects that, when considered together, are considerable or that compound or increase other environmental impacts. The cumulative impact is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time. For biological resources, there is the potential for cumulative impacts to result if similar resources are affected by both the project and one or more of the related projects. The past, present, and reasonably future projects (i.e., cumulative projects) used for this analysis included a project list (Table 3 in the Traffic Impact Analysis) that included the Mesa Verde Specific Plan (directly adjacent to the west), the 76/Circle K Fuel Station and C-Store and RV Fueling Facility/Gas Station (both to the north of the site, west of I-10, but not directly adjacent), and Summerwind Specific Plan (to the south of the site, west of I-10, but not directly adjacent). Each of these projects is also planned for undeveloped natural areas. All other cumulative projects on Table 3 are farther away, on the other side of I-10, and not likely to have a cumulatively considerable impact due to their distance away from the project site, as well as being infill development sites in a relatively developed area of the City.

Alternatively, a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable through mitigation measures set forth in an MND or if the project will comply with the requirements in a previously approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located. Specific environmental factors addressed throughout this IS/MND are discussed in greater detail below with respect to cumulative impacts.

As shown in the environmental analysis in this IS/MND, the proposed project was determined to have no impact related to agriculture and forestry resources, mineral resources, recreation, or wildfire. Because the project would have no impact in relation to these factors, it would not have the potential to contribute to a significant effect created by the combined impacts of closely related projects.

Impacts related to aesthetics, air quality, energy, GHG emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, population and housing, public services, transportation, and utilities and service systems were determined to be less than significant without the need for mitigation measures. However, even though the impacts in these areas are less than significant on a project level, they could still have the potential to contribute to a cumulative impact. The following discussion addresses the potential for each of these less-than-significant impact areas to contribute to a cumulative impact.

Mitigation would be required to reduce impacts to less than significant levels for biological resources (special-status wildlife species and conflict with an adopted habitat conservation plan), cultural resources, geology and soils (paleontological resources), noise (construction only), and TCRs. However,

even though the impacts can be reduced to less than significant on a project level with the incorporation of mitigation, they could still have the potential to contribute to a cumulative impact. The following discussion addresses the potential for each of these less than significant mitigation impact areas to contribute to a cumulative impact.

Aesthetics

Although the proposed project would be constructed on land that is currently undeveloped and would therefore change the visual character of the project site, its design would be similar in character and design to existing adjacent development. The project would introduce land uses that are consistent with the vision of the City's General Plan. Assuming that future development in the vicinity of the project site is similarly compliant with the vision of the General Plan, cumulative development in the area would be cohesive and would improve the cumulative aesthetic character of the area. Additionally, although the project would add nighttime lighting to the project vicinity, the lights would be shielded and directed downward to focus lighting within desired areas and minimize light spillover onto adjacent properties. Lighting impacts from the project, as well as lighting impacts of any future development within the vicinity of the project site, would be required to comply with the City's Municipal Code, Chapter 18.120.090 and Title 24 of the California Code of Regulations, Part 6 (and any successor regulations), and the Uniform Building and Electrical Codes, which contain requirements to minimize light spillover for each individual development. This in turn minimizes cumulative impacts related to lighting. As such, because the proposed project would minimize light spillover through design elements and compliance with codes and regulations related to lighting, it would not result in a cumulatively considerable contribution to lighting impacts.

Air Quality

Air pollutant and GHG emissions, as assessed under CEQA, are inherently recognized as cumulative impacts. Project-level thresholds of significance for these emissions are used in the determination of whether a project's individual emissions would result in a cumulatively considerable contribution to a significant impact. Based on the analysis contained in this IS/MND, both air quality and GHG emissions would remain substantially below the defined thresholds of significance. Therefore, the proposed project would not result in a cumulatively considerable contribution to a wider adverse air quality or GHG impact.

Biological Resources

As discussed in Section 3.4, the proposed project has the potential to impact special-status wildlife species and could result in conflict with a habitat conservation plan if mitigation is not implemented. Cumulative impacts to these resources are analyzed in this section. The proposed project is not expected to result in impacts to sensitive vegetation communities or rare plants, riparian habitat, federally protected wetlands, or wildlife corridors, habitat linkages, or native wildlife nursery sites, nor is it expected to conflict with local policies protecting biological resources. Because the project would not incrementally contribute to the cumulative impacts of these biological resources, they are not addressed in the cumulative impact analysis.

Most of the related cumulative projects are projects at a distance from the project site, divided by a major freeway, or isolated from naturalized areas by surrounding development. As such, these related projects would not be expected to support habitat that would be suitable for most special-status plant and wildlife species or to contain other sensitive biological resources that could be incrementally impacted by the proposed project. Therefore, with the exception of special-status wildlife and conflict with a habitat

conservation plan, which could occur in urban settings in the City, nearly all of the related projects would not result in incremental impacts to sensitive biological resources. Four related cumulative projects (Mesa Verde Specific Plan, 76/Circle K Fuel Station and C-Store, RV Fueling Facility/Gas Station, and Summerwind Specific Plan) are located in areas that may support similar habitats and present similar potential biological constraints to those present on the proposed project site. Therefore, the proposed project has the potential to incrementally contribute to cumulative impacts on protected biological resources, including special-status wildlife species and their habitat, and conflict with a habitat conservation plan.

As discussed in the analysis in Section 3.4, implementation of **MM BIO-1** through **MM BIO-4** would reduce all potential project impacts to less than significant. With implementation of the project-specific mitigation measures, the project's incremental effect on special-status species and conflict with a habitat conservation plan would be less than significant when viewed in connection with the effects of the cumulative projects. Further, all cumulative projects would be subject to existing and/or future permit restrictions that satisfy applicable regulatory requirements. Lastly, the proposed project and the cumulative projects are located within the plan boundary of the Western Riverside County MSHCP, and the City is a signatory to the MSHCP Implementing Agreement. Based on this analysis, the project's incremental effect on biological resources would not be cumulatively considerable, and cumulative impacts on biological resources would be less than significant with mitigation. Regarding conflicts with a regional habitat conservation plan, in this case, the MSHCP, the project would comply with **MM BIO-3**, requiring completion of the JPR process prior to project approval, and would not result in conflicts with the MSHCP. As a result, this issue would not be considered cumulatively considerable.

Potential impacts to biological resources (nesting birds and burrowing owl) were determined to be less than significant through compliance with existing policies or regulations or with the implementation of mitigation measures proposed based on the results of the environmental analysis contained in the IS/MND. However, such impacts, should they occur, are site-specific in nature and are limited to the project construction footprint; therefore, they would not result in a cumulatively considerable contribution to similar potentially adverse impacts resulting from other closely related projects in the vicinity.

Cultural Resources

Potential impacts to cultural resources (e.g., the inadvertent discovery of unknown buried archaeological, paleontological, or TCRs, as well as human remains), were determined in this IS/MND to be less than significant through compliance with existing policies or regulations or with the implementation of mitigation measures introduced based on the results of the environmental analysis contained in the IS/MND. However, such impacts, should they occur, are site-specific in nature and are limited to the project construction footprint; therefore, they would not result in a cumulatively considerable contribution to similar potentially adverse impacts resulting from other closely related projects in the vicinity.

Energy

The use of energy is considered an impact with potentially broader effects based on the consumption of limited resources often required to produce energy. However, it was determined in this IS/MND that although the project would increase energy use, the use would be a small fraction of the statewide use, and due to efficiency increases is expected to diminish over time (particularly with respect to petroleum). Given these considerations, it was determined that energy consumption associated with the project would

not be considered inefficient or wasteful. Therefore, the proposed project would not result in a cumulatively considerable contribution to a wider adverse impact related to energy consumption and conservation.

Geology

Geology and hydrology impacts related to increased potential for erosion, runoff, siltation, flooding, and pollution discharges would generally be site-specific in nature, but such impacts could also extend off site and result in a larger impact when combined with similar impacts from closely related projects in the area. However, through compliance with existing policies or regulations (NPDES permit and SWPPP), off-site impacts would be largely eliminated and therefore would not result in a cumulatively considerable contribution to a more widespread impact potentially created by the combined effects of closely related projects.

Although determined to be less than significant, geology impacts related to seismic hazards and hazards created by various soil conditions pertain to the potential impacts from the environment on the proposed project rather than impacts to the environment caused by the project. In this regard, the project would not result in a cumulatively considerable contribution to similar impacts experienced by closely related projects in the area.

Greenhouse Gas Emissions

Global climate change is a cumulative impact; a project contributes to this impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. Thus, GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008). As shown in Table 16, Estimated Annual Operational Greenhouse Gas Emissions (2027), in Section 3.8, the proposed development project would not exceed the industrial threshold of 10,000 MT CO_2e per year as established by SCAQMD. In addition, the development applicant would be required to include the minimal energy efficiency and water conservation measures to the proposed development project, as required for small projects in the CAP.

The proposed project would not interfere with implementation of any of the above-described GHG reduction goals for 2030 or 2050 because the project would not exceed the SCAQMD's recommended threshold of 10,000 MT CO_2e per year (SCAQMD 2008). Because the proposed development project would not exceed the threshold, this analysis provides support for the conclusion that the project would not impede the state's trajectory toward the above-described statewide GHG reduction goals for 2030 or 2050.

The proposed project's consistency with the state's Scoping Plan would assist in meeting each jurisdiction's contribution to GHG emission reduction targets in California. With respect to future GHG targets under SB 32 and EO S-3-05, CARB has also made clear its legal interpretation that it has the requisite authority to adopt whatever regulations are necessary, beyond the AB 32 horizon year of 2020, to meet the SB 32 40% reduction target by 2030 and the EO S-3-05 80% reduction target by 2050. This legal interpretation by an expert agency provides evidence that future regulations will be adopted to continue the trajectory toward meeting these future GHG targets.

Based on the above considerations, the proposed development project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. The project would not result in a cumulatively considerable contribution to GHG emissions.

Hazards and Hazardous Materials

Construction at the development project site would involve the temporary use and transport of small quantities of common hazardous and/or flammable materials, including diesel fuel, gasoline, and other oils and lubricants. The use, storage, transport, and disposal of these materials would comply with all existing local, state, and federal regulations. Should a spill occur, its impact would be minimized through adherence to applicable regulations. Additionally, the impact would be highly localized and would therefore not be likely to combine with those used for other development projects in the area to create a cumulatively considerable effect. During the operation phase of the development project, gasoline and diesel fuel would be routinely handled, stored, and dispensed on the project site, including fuels being transported to and stored in five proposed USTs. In addition to required adherence to state and federal regulations related to the transport of hazardous materials and regulations related to the installation, modification, repair or removal of USTs, the developer would be required to prepare and implement a HMBP, which would assist the operator with compliance with state requirements and provide emergency responders with adequate information about the type and quantity of hazardous materials stored at a facility. Additionally, California Code of Regulations Title 23, Chapter 16 and Riverside County Ordinance 617 mandate regular monitoring, maintenance and inspection of USTs, which would ensure the safe and appropriate operation of the proposed UST on site (County of Riverside 2020). Adherence to the various regulations related to hazardous materials would minimize the chance of a spill. However, should a spill occur, its impact would be localized and not anticipated to combine with hazardous materials releases from other development projects in the area to create a cumulatively considerable effect.

Hydrology and Water Quality

Groundwater would be required for operation of the proposed project. However, the project site sources its water from the San Timoteo Subbasin, which is classified as low to very low priority with respect to groundwater basin prioritization and has water table elevations that have not declined over the years. Additionally, the non-adjudicated portion of the San Timoteo Subbasin is managed by the San Timoteo GSA, which in turn coordinates with the Eastern Municipal Water District, which manages a separate GSA in the southern non-adjudicated portion of the subbasin. As such, the subbasin is managed for the collective users of the subbasin. As such, the proposed project would not result in a cumulatively considerable contribution to groundwater depletion.

Land Use and Planning

The analysis in this IS/MND determined that the proposed project is consistent with applicable land use plans, policies, and regulations. A main goal of land use plans, policies, and regulations is to manage growth and development patterns holistically for a specified area. As such, the proposed project would not result in a cumulatively considerable incremental contribution to land use inconsistency in relation to other projects in the vicinity.

The project would be developed in accordance with the land use designation applied to the site by the City of Calimesa General Plan. The proposed project would generate approximately 15 new employment opportunities, which is small in relation to the total employment within the City and which would not exceed the growth anticipated by the City and evaluated in the SCAG RTP/SCS. The proposed project would not result in a cumulatively considerable incremental contribution to population growth.

Noise

Impacts related to noise have the potential to affect a limited area beyond the boundaries of the project site. However, the assessment of such impacts in this IS/MND concluded that project noise during operation would be less than significant and that construction noise would be less than significant with mitigation incorporated. These conclusions accounted for the combined effect of the project and the surrounding existing setting. The Mesa Verde Estates Specific Plan has been approved immediately west of the project site, but the site is currently undeveloped and construction is not going to overlap with construction of the proposed project (opening year of Mesa Verde Estates Specific Plan Phase I is 2030). The Summerwind Ranch at Oak Valley Specific Plan has also been approved to the south of the proposed project site. Development has occurred within the southern portion of the specific plan area, farthest away from the proposed project site. Construction within the specific plan area close to the proposed project site is not underway and is not likely to overlap with construction of the proposed project. As such, the project's construction noise would not combine with noise from surrounding construction projects to contribute to a significant cumulative impact.

Population and Housing

Impacts related to population and housing would not be cumulatively considerable even though the proposed development project would generate new employment opportunities (15 employees). It would not result in growth that was not already anticipated by the City and evaluated in the SCAG RTP/SCS. Furthermore, the development project site is served by existing public roadways and utility infrastructure already installed beneath public right-of-way that abuts the property. Therefore, the project in combination with other growth in the City would not result in a significant cumulative impact.

Public Services

Operation of the proposed project on the currently vacant site would increase the demand for public services, including fire and police protection. However, the analysis in this IS/MND determined that the proposed project would not cause staffing, facilities, or equipment to operate at a deficient level of service such that construction of new or expanded fire or police protection facilities would be required. Additionally, the development applicant would be required to pay Developer Impact Fees, which provides a funding source for construction of fire and police facilities as a result of impacts related to future growth in the City. As such, the proposed project would not result in a cumulatively considerable incremental contribution to impacts on the ability of fire or police facilities to meet performance objectives.

Transportation

The proposed project would be designed to comply with applicable plans, ordinances, and policies that establish measures of effectiveness for the performance of the circulation system as a whole. Additionally, the project includes local-serving retail uses, which would shorten the distance that patrons would otherwise travel to other similar uses. As such, the proposed project would not result in a cumulatively considerable incremental contribution to traffic delays and would have a positive impact on VMT.

Tribal Cultural Resources

Potential impacts to TCRs were determined in this IS/MND to be less than significant with the implementation of **MM CUL-1**, **MM CUL-2**, **MM TCR-1**, and **MM TCR-2**, based on tribal consultation. However, such impacts, should they occur, are site specific in nature and would be limited to the project construction footprint. Therefore, project impacts would not result in a cumulatively considerable contribution to similar potentially adverse impacts resulting from other closely related projects in the vicinity.

Utilities and Service Systems

Impacts to utilities and service systems could contribute to a significant impact from the combined effects of more than one project on the limited capacity of services such as wastewater treatment, water supply, and solid waste disposal. However, the analysis in this IS/MND determined that the proposed project is relatively small and would not have a significant impact on the availability of groundwater for City water supply; that the Wochholz Regional Water Recycling Facility, which serves the project site, would have adequate capacity to serve the proposed development project; and that the proposed project would not result in the generation of solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure. Therefore, the project would result in a less than cumulatively considerable incremental contribution to any combined effect created by other projects.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less Than Significant Impact with Mitigation Incorporated. Direct and indirect environmental effects on human beings were analyzed in the following sections: aesthetics, air quality, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, and transportation. As found in the discussion for each relevant section, the project would not result potentially significant impacts to human beings, either directly or indirectly. The proposed project would be required to comply with all applicable federal, state, and local policies and regulations. For example, the City would require its contractor to implement measures and methods that would ensure compliance with the average sound level limits established by each jurisdiction's Noise Ordinances, as applicable. As such, the proposed project would not result in environmental effects that would cause substantial adverse effects on human beings.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	27.8	annual days of extreme heat
Extreme Precipitation	5.10	annual days with precipitation above 20 mm

Sea Level Rise	—	meters of inundation depth
Wildfire	21.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	100
AQ-PM	46.7
AQ-DPM	62.3
Drinking Water	49.6
Lead Risk Housing	31.0
Pesticides	2.00
Toxic Releases	42.8
Traffic	61.1
Effect Indicators	—

CleanUp Sites	0.00

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	26.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	No demolition.
Construction: Trips and VMT	Based on applicant provided information.
Operations: Water and Waste Water	Based on landscaping plan.
Operations: Vehicle Data	Based on traffic impact analysis.
Operations: Fleet Mix	EMFAC fleet mix for diesel vehicles fueled in Riverside County.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	27.8	annual days of extreme heat
Extreme Precipitation	5.10	annual days with precipitation above 20 mm

Sea Level Rise	—	meters of inundation depth
Wildfire	21.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	100
AQ-PM	46.7
AQ-DPM	62.3
Drinking Water	49.6
Lead Risk Housing	31.0
Pesticides	2.00
Toxic Releases	42.8
Traffic	61.1
Effect Indicators	—

CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	65.9
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	29.1
Cardio-vascular	59.6
Low Birth Weights	33.7
Socioeconomic Factor Indicators	—
Education	53.1
Housing	28.2
Linguistic	5.64
Poverty	44.1
Unemployment	65.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	49.39047863
Employed	7.955857821
Median HI	28.39727961
Education	—
Bachelor's or higher	26.08751444
High school enrollment	100
Preschool enrollment	1.873476197
Transportation	—

Auto Access	49.51879892
Active commuting	1.039394328
Social	—
2-parent households	69.19029899
Voting	52.71397408
Neighborhood	—
Alcohol availability	64.81457718
Park access	7.108943924
Retail density	18.0803285
Supermarket access	33.60708328
Tree canopy	28.66675221
Housing	—
Homeownership	88.78480688
Housing habitability	65.43051456
Low-inc homeowner severe housing cost burden	14.98780957
Low-inc renter severe housing cost burden	43.75721802
Uncrowded housing	68.66418581
Health Outcomes	—
Insured adults	54.27948159
Arthritis	0.0
Asthma ER Admissions	71.8
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	6.1

Cognitively Disabled	17.4
Physically Disabled	20.3
Heart Attack ER Admissions	14.8
Mental Health Not Good	0.0
Chronic Kidney Disease	0.0
Obesity	0.0
Pedestrian Injuries	45.8
Physical Health Not Good	0.0
Stroke	0.0
Health Risk Behaviors	—
Binge Drinking	0.0
Current Smoker	0.0
No Leisure Time for Physical Activity	0.0
Climate Change Exposures	—
Wildfire Risk	16.1
SLR Inundation Area	0.0
Children	90.2
Elderly	16.2
English Speaking	59.2
Foreign-born	10.6
Outdoor Workers	12.6
Climate Change Adaptive Capacity	—
Impervious Surface Cover	86.4
Traffic Density	61.9
Traffic Access	23.0
Other Indices	—
Hardship	60.4
Other Decision Support	—

2016 Voting	74.2

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	26.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	No demolition.
Construction: Trips and VMT	Based on applicant provided information.
Operations: Water and Waste Water	Based on landscaping plan.
Operations: Vehicle Data	Based on traffic impact analysis.
Operations: Fleet Mix	EMFAC fleet mix for diesel vehicles fueled in Riverside County.

Sandalwood Travel Center Gasoline VOC Emissions

Annual Throughput Gasoline: 1,800,000 gal/year
Operating Schedule: 365 days/year

Sandalwood Travel Center HRA Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

3. Construction Emissions Details

3.1. Site Preparation (2025) - Unmitigated

3.3. Grading (2025) - Unmitigated

3.5. Building Construction (2025) - Unmitigated

3.7. Building Construction (2026) - Unmitigated

3.9. Paving (2026) - Unmitigated

3.11. Architectural Coating (2026) - Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	27.8	annual days of extreme heat
Extreme Precipitation	5.10	annual days with precipitation above 20 mm

Sea Level Rise	—	meters of inundation depth
Wildfire	21.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	100
AQ-PM	46.7
AQ-DPM	62.3
Drinking Water	49.6
Lead Risk Housing	31.0
Pesticides	2.00
Toxic Releases	42.8
Traffic	61.1
Effect Indicators	—

CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	65.9
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	29.1
Cardio-vascular	59.6
Low Birth Weights	33.7
Socioeconomic Factor Indicators	—
Education	53.1
Housing	28.2
Linguistic	5.64
Poverty	44.1
Unemployment	65.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	49.39047863
Employed	7.955857821
Median HI	28.39727961
Education	—
Bachelor's or higher	26.08751444
High school enrollment	100
Preschool enrollment	1.873476197
Transportation	—

Auto Access	49.51879892

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	35.0
Healthy Places Index Score for Project Location (b)	26.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	No demolition.
Construction: Trips and VMT	Based on applicant provided information.
Operations: Water and Waste Water	Based on landscaping plan.
Operations: Vehicle Data	Based on traffic impact analysis. Trip length based on AERMOD sources.
Operations: Fleet Mix	EMFAC fleet mix for diesel vehicles fueled in Riverside County.

                                            ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   112 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   2492442.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    112 Source(s);       1 Source Group(s); and    1179
Receptor(s)
```

```
                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    112 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   475.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Sandalwood Construction.err

 **File for Summary of Results:   Sandalwood Construction.sum

- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   881 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   2492442.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: VARIOUS

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    881 Source(s);       7 Source Group(s); and    1053
Receptor(s)
```

```
                with:      2 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    879 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   475.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                    ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      5.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Sandalwood Construction.err

 **File for Summary of Results:   Sandalwood Construction.sum
